## The $\pi^0$ Lifetime: Experimental Probe of the QCD Axial Anomaly

### Outline

- Physics Motivation
- Experimental Overview
- Calibration Reactions
  - Pair Production
  - Compton Scattering
- $\pi^0$  Analysis Details
- Preliminary  $\Gamma_{\pi^0 \rightarrow \gamma\gamma}$  Result
- Summary and Outlook

## Physics Motivation: Anomalies in QCD

- Anomaly: When a symmetry of the classical theory is not present in the quantized version.
- In QCD, the anomaly is not anomalous, it is an essential part of the theory.
- For which processes does the anomaly occur?
  - Define a multiplicative quantum number “natural parity” (NP) = 1 for S, V, ... particles. NP = -1 for PS, PV, ...
  - An anomalous reaction changes the NP:
    - $\gamma\pi(\text{NP} = -1) \longrightarrow \gamma\pi(\text{NP} = -1)$  not anomalous
    - $\pi^0(\text{NP} = -1) \longrightarrow \gamma\gamma(\text{NP} = 1)$  anomalous
    - $\gamma\pi(\text{NP} = -1) \longrightarrow \pi\pi(\text{NP} = 1)$  anomalous
- All anomalous reactions are governed by the Wess-Zumino Lagrangian in ChPT
- In the Chiral limit, the absolute rate of these reactions are predicted by QCD

## Physics Motivation

- $\pi^0$  decay rate is a fundamental prediction of QCD.

### Chiral Anomaly

Presence of closed loop triangle diagram results in nonconserved axial vector current, even in the limit of vanishing quark masses.

→ In the leading order (chiral limit), the anomaly leads to the decay width:

$$\Gamma_{\pi^0 \rightarrow \gamma\gamma} = \frac{\alpha^2 m_\pi^3}{64\pi^3 F_\pi^2} = 7.725 \pm 0.044 \text{ eV} \quad (1)$$

where  $F_\pi = 92.42 \pm 0.25 \text{ MeV}$  is the pion decay constant.

→ Current Particle Data Book value is  $7.84 \pm 0.56 \text{ eV}$

## Physics Motivation

- LO prediction exact in Chiral limit
- For  $m_q \rightarrow 0$ , there are corrections:
  - Due to isospin sym-breaking ( $m_u \neq m_d$ ),  $\pi^0$ ,  $\eta$  and  $\eta'$  mixing induced.
  - Further corrections induced by terms in the Chiral Lagrangian.
- NLO prediction for the decay width is  $8.10 \text{ eV} \pm 1\%$ 
  - Calc. using Chiral Perturbation Theory and  $1/N_c$  expansion.
- A precision measurement of the  $\pi^0$  decay width is needed.

J.L.Goity et al, Phys. Rev. D66, 076014 (2002); B.Moussallam, Phys. Rev. D51, 4939 (1995)

→ This is 4% higher than current experimental value!

## CERN (Direct Method) Decay Length Measurement

→  $\tau_{\pi^0} \sim 1 \times 10^{-16}$  s  $\Rightarrow$  too small to measure

→ Solution—Measure decay length of highly energetic  $\pi^0$ 's:

$$L = v\tau_{\pi^0}E/m \quad (2)$$

→ for  $E = 1000\text{GeV}$ ,  $L \sim 100\mu\text{m}$  (very challenging experiment)

→ Performed in 1984:  
Used 450GeV protons

→ Result:

$$\Gamma_{(\pi^0 \rightarrow \gamma\gamma)} = 7.34\text{eV} \pm 3.1\%$$

→ Dominant syst. error:  
Uncertainty in  $E_{\pi^0}$  ( $\pm 1.5\%$ )

## The Primakoff Effect

- $\pi^0$  photoproduction from Coulomb field of nucleus.
- Equivalent production ( $\gamma\gamma^* \rightarrow \pi^0$ ) and decay ( $\pi^0 \rightarrow \gamma\gamma$ ) mechanism implies Primakoff cross section proportional to  $\pi^0$  lifetime.
- Primakoff  $\pi^0$  produced at very forward angles.

$$\frac{d\sigma_P}{d\Omega} = \Gamma_{(\pi^0 \rightarrow \gamma\gamma)} \frac{8\alpha_{em} Z^2 \beta^3 E^4}{m^3 Q^4} |\tilde{F}_{em}(Q)|^2 \sin^2 \theta_\pi \quad (3)$$

## Full Cross Section Components

$$\frac{d\sigma_{\pi^0}}{d\Omega} = \frac{d\sigma_P}{d\Omega} + \frac{d\sigma_C}{d\Omega} + \frac{d\sigma_I}{d\Omega} + 2 \cdot \sqrt{\frac{d\sigma_P}{d\Omega} \cdot \frac{d\sigma_C}{d\Omega}} \cos(\phi) \quad (4)$$

Primakoff    Nucl.Coherent    Incoherent    Interference

**Primakoff:**

Proportional to  $Z^2$ ,  
peaked at  $\theta_{\pi^0} = m_{\pi^0}^2 / 2E_\gamma^2$

**Nuclear Coherent:**

$$\frac{d\sigma_C}{d\Omega} = C \cdot A^2 |F_N(Q)|^2 \sin^2 \theta_\pi \quad (5)$$

**Nuclear Incoherent:**

$$\frac{d\sigma_I}{d\Omega} = \xi A (1 - G(Q)) \frac{d\sigma_H}{d\Omega} \quad (6)$$

**Interference:**

## Experiment Overview

- Conducted at Jefferson Lab, Fall 2004
  - Used 5.75 GeV continuous  $e^-$  beam and Hall B  $\gamma$ -tagging facility
  - Tagged photons incident on 5%  $X_0$  targets:  $^{12}\text{C}$  and  $^{208}\text{Pb}$
  - New PrimEx/Hall B calorimeter (HyCal), upstream of CLAS, designed to detect  $\pi^0$  decay  $\gamma$ 's
- Measured 3 physical processes (absolute cross sections): Primary -  $\pi^0$  production, Secondary - Compton and  $e^+e^-$  pair production
  - Improvements over previous experiments: Precision tagged  $\gamma$  flux and incident  $\gamma$  energy info, enhanced  $\pi^0$  angular and mass resolution, and identification and subtraction of background event contamination

## Experiment Overview

## Hall B Photon Tagger

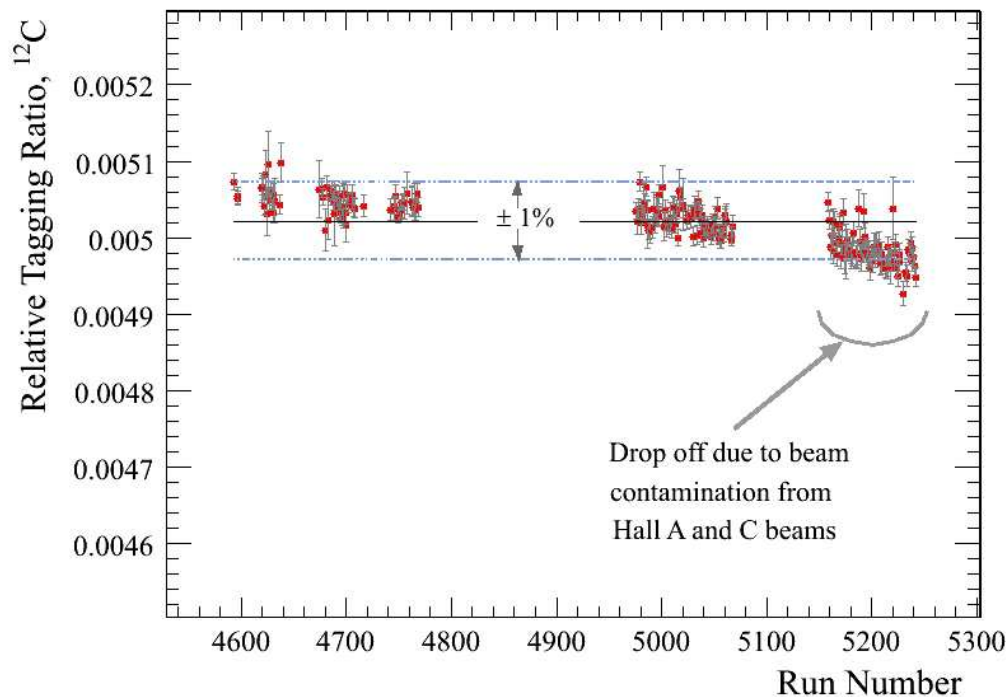

- Single dipole magnet combined with a hodoscope containing two planar arrays of plastic scintillators to detect energy-degraded electrons from a thin bremsstrahlung radiator.
- Tagger has 0.1% energy resolution and is capable of 50 MHz rates.

## Photon Flux Control

- PrimEx achievement: Total uncertainty in photon flux = 1.1%.
- Number of tagged photons on target ( $N_\gamma$ ) calibrated periodically using a Total Absorption Counter (TAC).
- Any drifts in the tagging ratio, occurring between calibration points, are monitored online with the  $e^+e^-$  pair spectrometer.

## PrimEx Hybrid Calorimeter – “HyCal”

- Optimal performance/cost design
- 1.2 m × 1.2 m, 1728 channels
- 576 Lead-glass (**outer layers**)
- 1152 Lead-Tungstenate crystal (**inner layers**)

	Lead-glass	PbWO <sub>4</sub>
Energy Res. ( $\Delta E/E$ )	3 – 5 %	1 – 2 %
Position Res. ( $\Delta x, y$ )	~ 5 mm	~ 1.5 mm
Angular Res. ( $\Delta\theta_{\pi^0}$ )	~ 675 $\mu\text{rad}$	~ 300 $\mu\text{rad}$

## PrimEx Hybrid Calorimeter – “HyCal”

## HyCal Calibration

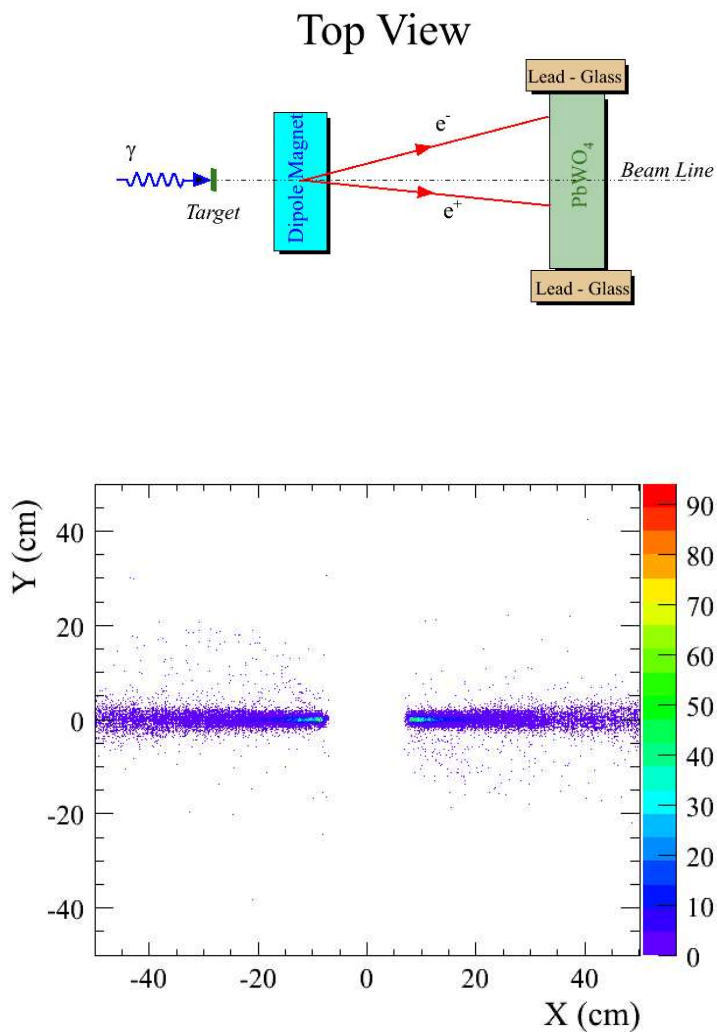

- Full x,y motion allowed each ch. to be scanned through tagged  $\gamma$  beam.
- Performed at both the beginning and end of the experiment.

## Calibration Reactions: $e^+ e^-$ Pair Production

## Calculation of Pair Production Cross Section at PrimEx Kinematics

- Bethe-Heitler mechanism of pair production on the nucleus with screening effects due to atomic electrons and Coulomb distortion
- Pair production off atomic electrons, considering excitation of all atomic states and correlation effects due to the presence of other electrons and the nucleus
- Radiative corrections (of order  $\alpha/\pi$ ) (i) virtual photon loops and (ii) real photon process like  $\gamma + A \rightarrow e^+ + e^- + A + \gamma$
- Nuclear incoherent contribution,  $\gamma + p \rightarrow e^+ + e^- + p$
- Nuclear coherent contribution (VCS),  $\gamma + A \rightarrow \gamma^* + A \rightarrow e^+ + e^- + A$

## Pair Production Preliminary Result

- Agreement with theory at  $\sim 1.0\%$  level

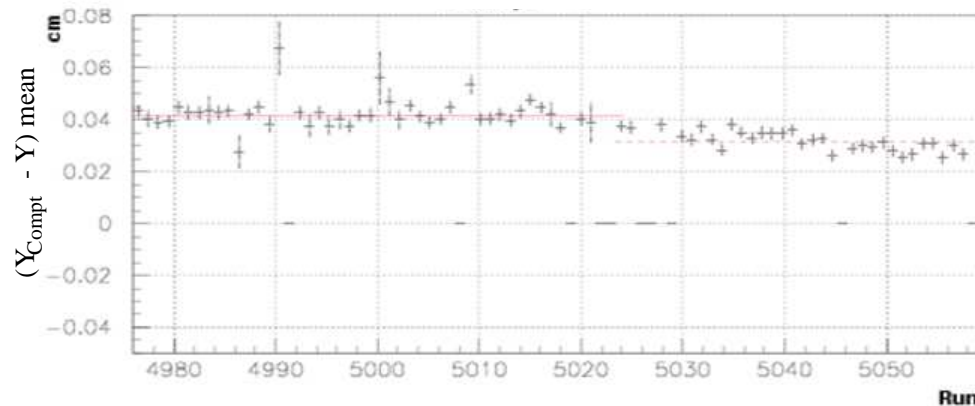

## Calibration Reactions: Compton Scattering

- A well known process, useful in several ways:
  - Detector/beam alignment
  - HyCal gain monitoring
  - Overall check of PrimEx setup to measure absolute cross sections
    - Dedicated "Double-Arm" Compton Runs:
      - Performed on a weekly basis,  $B_{PS} = 0$ ,  $I_{beam} \sim 5 - 10$  nA
      - Both  $e^-$  and scattered photon detected in HyCal
      - Compton Cross Section Measured:  $^{12}C$  and  $0.5\% X_0$   $^4Be$
    - "Single-Arm" Compton Data:
      - Dominant Source of Events in  $\pi^0$  production dataruns
      - $B_{PS} \sim 2$  T,  $I_{beam} \sim 100$  nA, only scattered photon detected

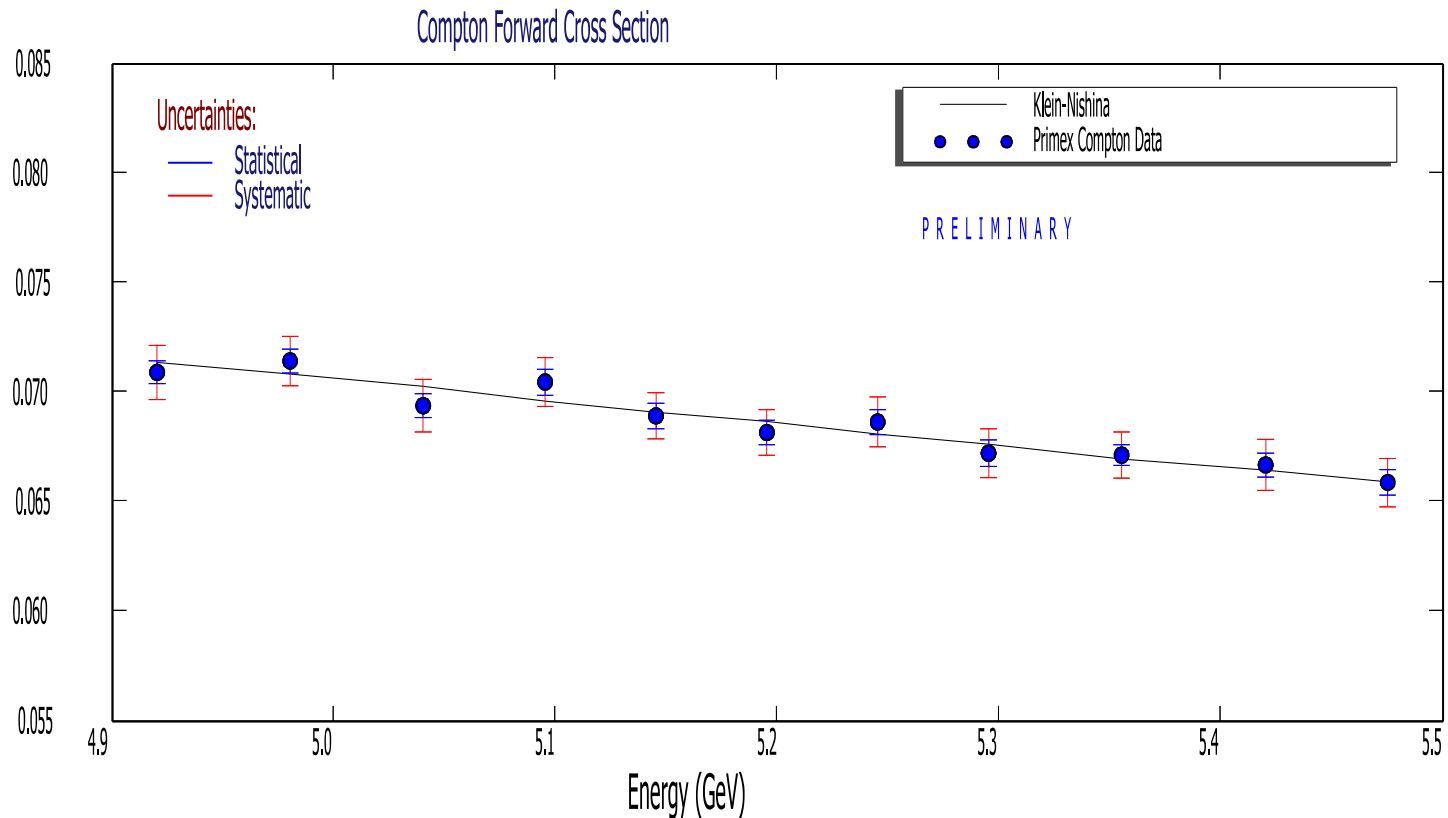

## Beam Alignment Monitoring using Single-Arm Compton

- Only scattered  $\gamma$  measured
- $X \equiv$  reported HyCal coord
- $X_{\text{Compt}} \equiv$  calc. (x,y) from Hycal E and Compton kin.
- If beam alignment perfect:  $(X_{\text{Compt}} - X) = 0$
- Technique tracks alignment at 0.1 mm level
- Jump in X correlated with beamline BPM

## Compton Cross Section Preliminary Result

- Average statistical error: 0.6%
- Total error: 1.3% (dominated by photon flux: 1.0%)

## Analysis Details: $\pi^0$ Event Selection

We measure:

- initial photon energy:  $E_\gamma$
- energies of decayed photons:  $E_{\gamma 1}$ ,  $E_{\gamma 2}$
- X, Y positions of decayed photons

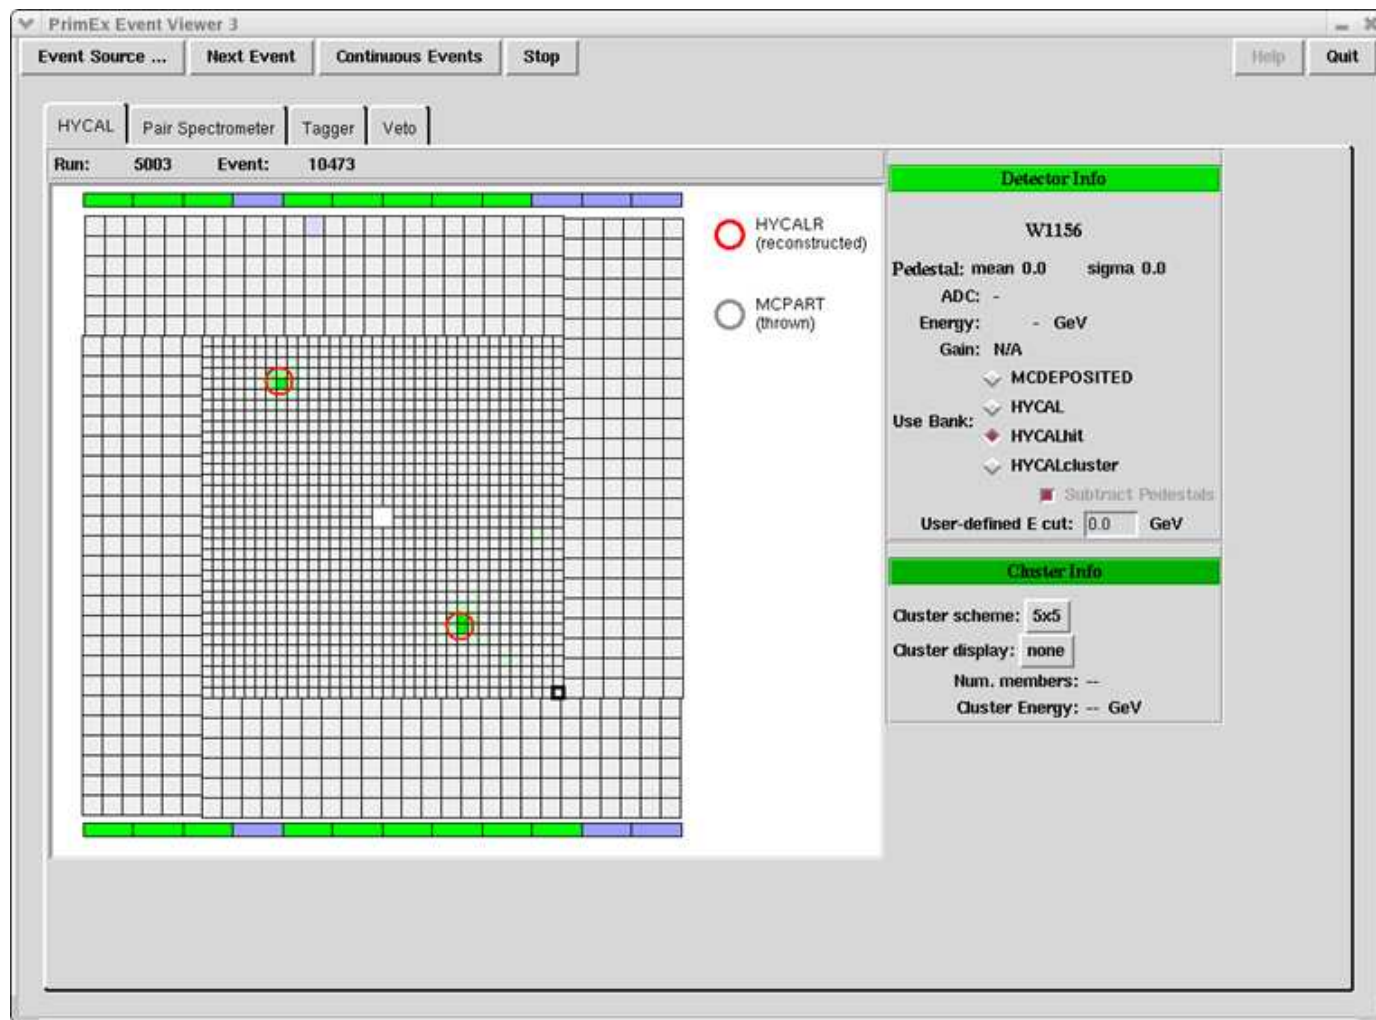

Kinematical constrains:

- Conservation of energy
- Conservation of momentum
- $m_{\gamma\gamma}$  invariant mass

## Analysis Details: $\pi^0$ Event Selection

## Analysis Details: $\pi^0$ Yield Extraction

### Extracting Elastic Pion Yields versus $\theta_{\pi^0}$

- For each  $\theta_{\pi^0}$  bin, apply elastic cut and form  $m_{\gamma\gamma}$  distributions; perform fit and extract peak counts = uncorrected yield.
- Correct for inelastic bkgd by evaluating  $\pi^0$  elasticity distribution explicitly for each  $\theta_{\pi^0}$ ; evaluate inelastic bkgd under the elastic peak using fit and subtract from yield.

## Analysis Details: Yield Result for $^{12}\text{C}$ and $^{208}\text{Pb}$

## Yield Results for $^{12}\text{C}$ and $^{208}\text{Pb}$

## Analysis Details: $\Gamma_{\pi^0 \rightarrow \gamma\gamma}$ Determination

- Convert Yield to Cross Section.

$$\frac{d\sigma_{exp}}{d\theta_{\pi^0}} = \frac{N_{\pi^0}^{yield}(\theta_{\pi^0})}{N_{\gamma} \times N_t \times \epsilon_{\pi^0}(\theta_{\pi^0}) \times \Delta\theta_{\pi^0}} \quad (7)$$

- where  $N_{\gamma} \equiv$  # of  $\gamma$ 's on target (uncertainty  $\sim 1.0\%$ ).
- where  $N_t \equiv$  target atoms/cm<sup>2</sup> (thickness mapped to  $\sim 0.05\%$ ).
- where  $\epsilon_{\pi^0} \equiv$  experimental acceptance (uncertainty  $\sim 0.6\%$ ).

- Fit experimental data with parameterization:

$$\frac{d\sigma_{exp}}{d\theta_{\pi^0}} = b_p \frac{d\sigma_P}{d\Omega} + b_c \frac{d\sigma_N}{d\Omega} + b_i \frac{d\sigma_I}{d\Omega} + 2\cos\phi \sqrt{b_p b_c \frac{d\sigma_P}{d\Omega} \frac{d\sigma_C}{d\Omega}} \quad (8)$$

- where the parameter  $b_p = \Gamma_{\gamma\gamma}$
- Vary the four parameters ( $b_p$ ,  $b_c$ ,  $b_i$ , and  $\phi$ ) and minimize  $\chi^2$ .

## Photon Flux

Flux for  $^{12}\text{C}$ :  $2.33 \times 10^{12} \gamma/\text{s}$

Flux for  $^{208}\text{Pb}$ :  $1.31 \times 10^{12} \gamma/\text{s}$

# Hycal Geometric acceptance of both $\pi^0$ decay $\gamma$ 's

HyCal  $\pi^0$  Geometric Acceptance (All Fiducials)

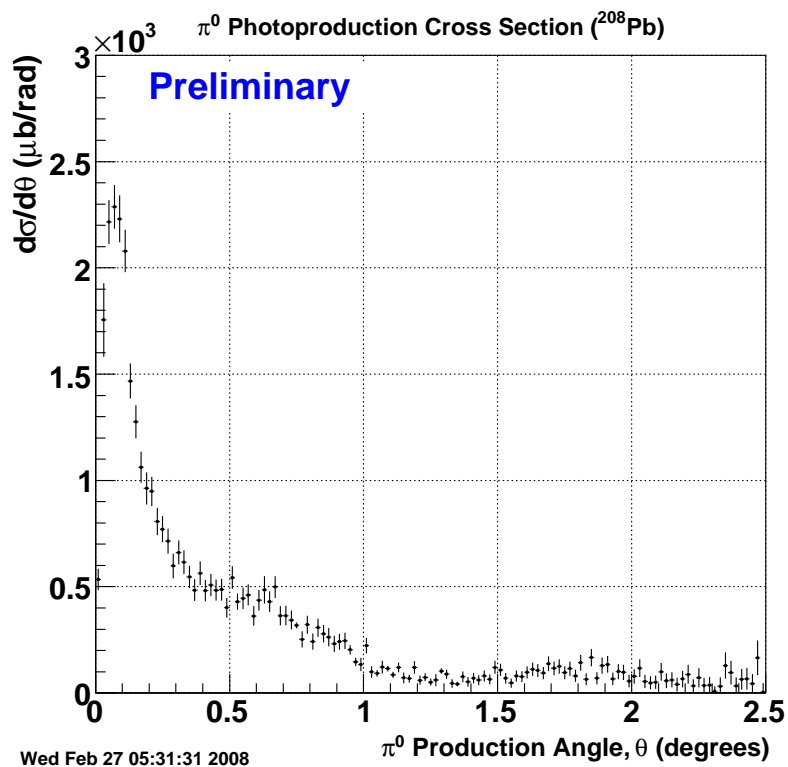

## Experimental Efficiencies: $^{12}\text{C}$

Description	Losses (%)	
	$^{12}\text{C}$	$^{208}\text{Pb}$
Photon Absorption in Target	$5.41 \pm 0.02$	$5.92 \pm 0.01$
Best (tdiff) Candidate selection	$2.5 \pm 0.3$	$1.1 \pm 0.3$
Elasticity Cut: [0.906, 1.086]	$1.7 \pm 0.3$	$1.7 \pm 0.3$
Veto Cut: all flags (0, 1, 2, 3)	$1.97 \pm 0.12$	$1.97 \pm 0.12$
Branching Ratio $\pi^0 \rightarrow \gamma\gamma$	$1.2 \pm 0.03$	$1.2 \pm 0.03$
Total	$12.8 \pm 0.5$	$11.9 \pm 0.4$

Table 1: Summary of non-geometric losses.

## Cross Sections

## Yield Fit, $\Gamma_{\gamma\gamma}$ Extraction: Procedure

- Parameterize yield using sum of 4 theoretical shapes—smeared according to experimental resolutions.
  - Calculate theory input shapes (cross sections) energy-weighted according to experimental flux.
  - Create  $\pi^0$  event generator based on above cross sections and run through Primsim Monte Carlo.
  - Digitize simulated data and reconstruct events using same algorithms as for real data. Produce simulated yield distributions with built-in experimental resolutions.
- Freely vary amplitudes of 4 shapes and minimize  $\chi^2$ .

## MC Shape Generation: Exmpl. Thrown & Det. Spectra

Thu Mar 20 10:21:03 2008

$^{12}\text{C}$ : —  $\theta_{\pi^0}$  Thrown —  $\theta_{\pi^0}$  Detected

Fri Mar 21 01:10:58 2008

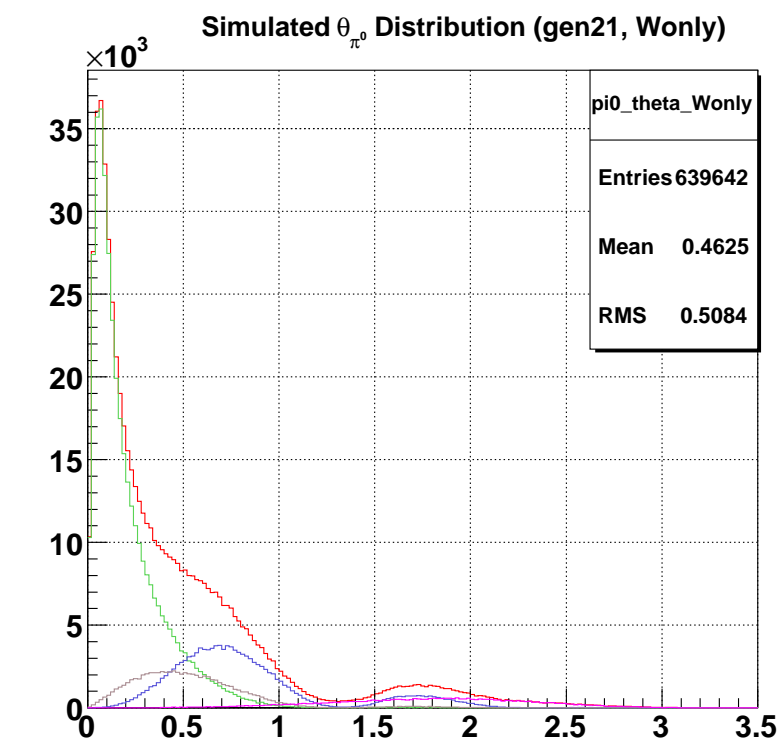

$^{208}\text{Pb}$ : —  $\theta_{\pi^0}$  Thrown —  $\theta_{\pi^0}$  Detected

## MC Shape Generation: Exmpl Fit Input Shapes (smeared)

Thu Mar 20 09:38:27 2008

Fri Mar 21 01:10:59 2008

## $^{12}\text{C}$ and $^{208}\text{Pb}$ Target Yield Fits

## Preliminary Systematic Error Table

Description	$\Gamma_{\gamma\gamma}$ dev (%)
$m_{\gamma\gamma}$ fits + inelast bkgd corr.	$\pm 1.1$
Inelastic bkgd shape uncert.	$\pm 0.75$
Photon flux	$\pm 0.98$
Experimental efficiencies	$\pm 0.5$
Fiducial Acceptance	$\pm 0.3$
Event Selection	$\pm 0.9$
$\pi^0$ bkgd from $\omega$ and $\rho$ decay	$\pm 1.0$
Target thickness	$\pm 0.1$
branch ratio	$\pm 0.03$
Tagged Photon Energy	$\pm 0.1$
Total Systematic Error	$\pm 2.3\%$

## Preliminary Theoretical Input (Model) Error Table

Description	$\Gamma_{\gamma\gamma}$ dev (%)	
	$^{12}\text{C}$	$^{208}\text{Pb}$
Incoherent XS shape uncert.	$\pm 1.35$	$\pm 0.11$
Nuclear coh. XS energy dep.	$\pm 0.16$	$\pm 0.06$
$F_{NC}$ intermediate state	$\pm 0.02$	$\pm 0.73$
$\pi$ -N cross section uncertainty		
Total Model Error	$\pm 1.38$	$\pm 0.74$

## $\Gamma_{\pi^0 \rightarrow \gamma\gamma}$ Preliminary Result

## Summary and Outlook

- High Quality precision  $\pi^0$  photoproduction data on  $^{12}\text{C}$  and  $^{208}\text{Pb}$  targets using  $4.9 \leq E_{\gamma}^{\text{tagged}} \leq 5.5$  GeV has been collected and analyzed by the PrimEx Collaboration.
- Preliminary cross section results from studied calibration reactions  $e^+e^-$  production and Compton scattering are both in excellent agreement with theory (at the 2 – 3% level).
- All three  $\sim$ independent  $\pi^0$  analysis groups have achieved very consistent results.
- The preliminary  $\pi^0$  partial width result:  
 $\Gamma_{\pi^0 \rightarrow \gamma\gamma} = 7.93\text{eV} \pm 1.8\%(\text{stat}) \pm 2.3\%(\text{syst}) \pm 1.1\%(\text{model})$ .
- The mean lifetime:  $(8.20 \pm 0.24) \times 10^{-17}$  s
- Preliminary  $\Gamma_{\pi^0 \rightarrow \gamma\gamma}$  results from both targets in excellent agreement.
- Continued work on reducing systematic error and finalizing results.
