## Showermax Monte Carlo Studies

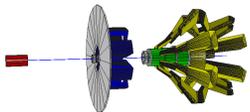

### Outline

- Reproduce 2008 “stack” results (benchmarking MC)
- New Showermax Design for MOLLER
  - Concept
  - Light guide geometry
  - Baseline performance (MC)
- Optimizing Design and Prototyping
- Summary

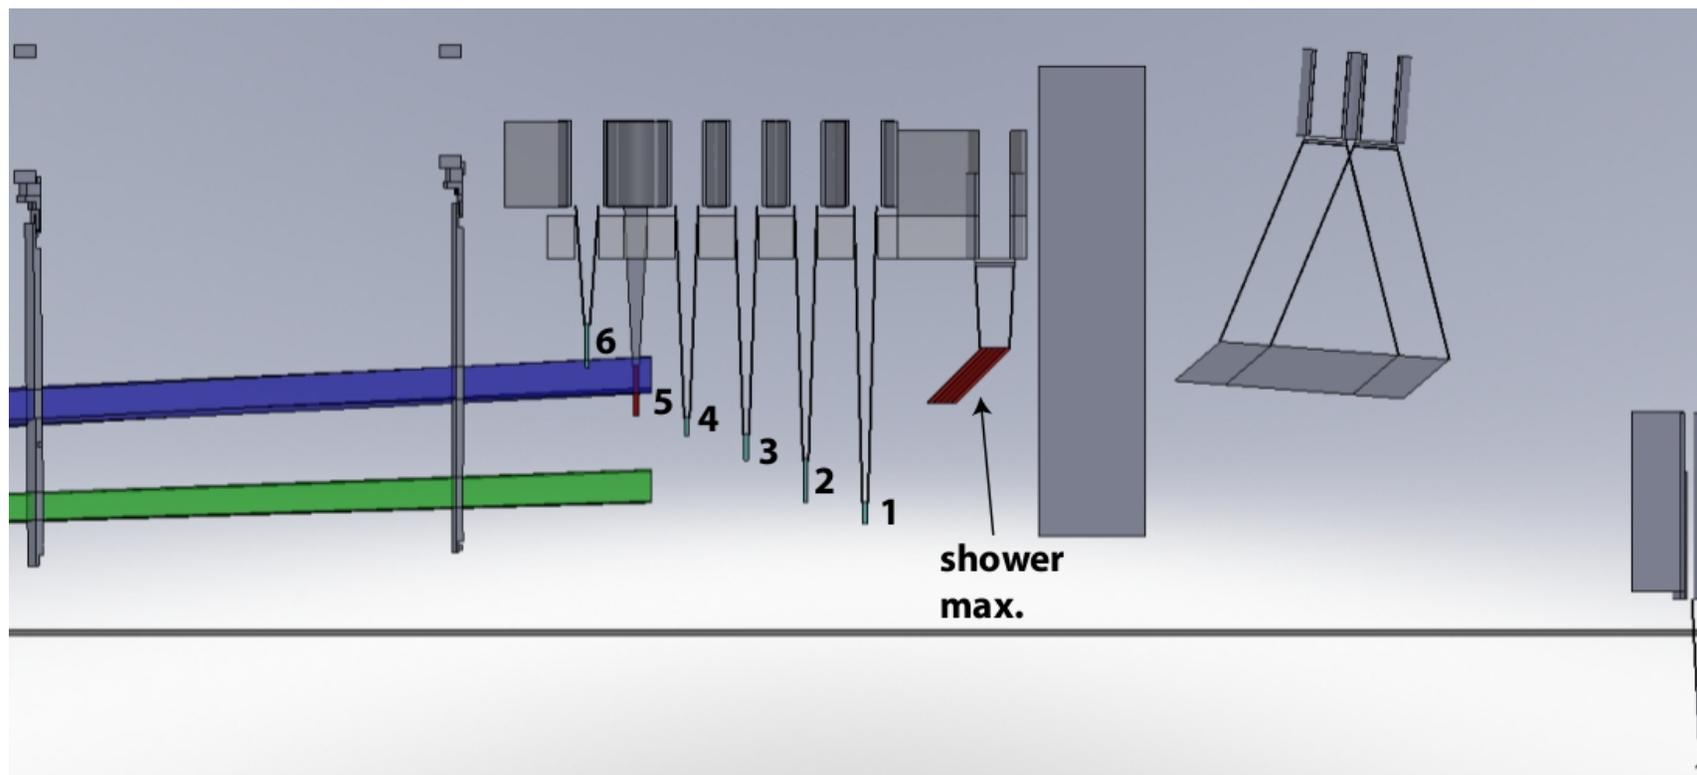

## Detector Ring Design Concept

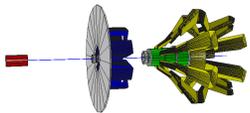

## Motivation

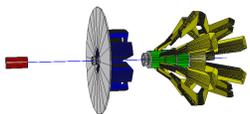

- Provides additional measurement of e-e ring flux
- Weights flux by energy  $\implies$  less sensitive to low energy/low light bkgds

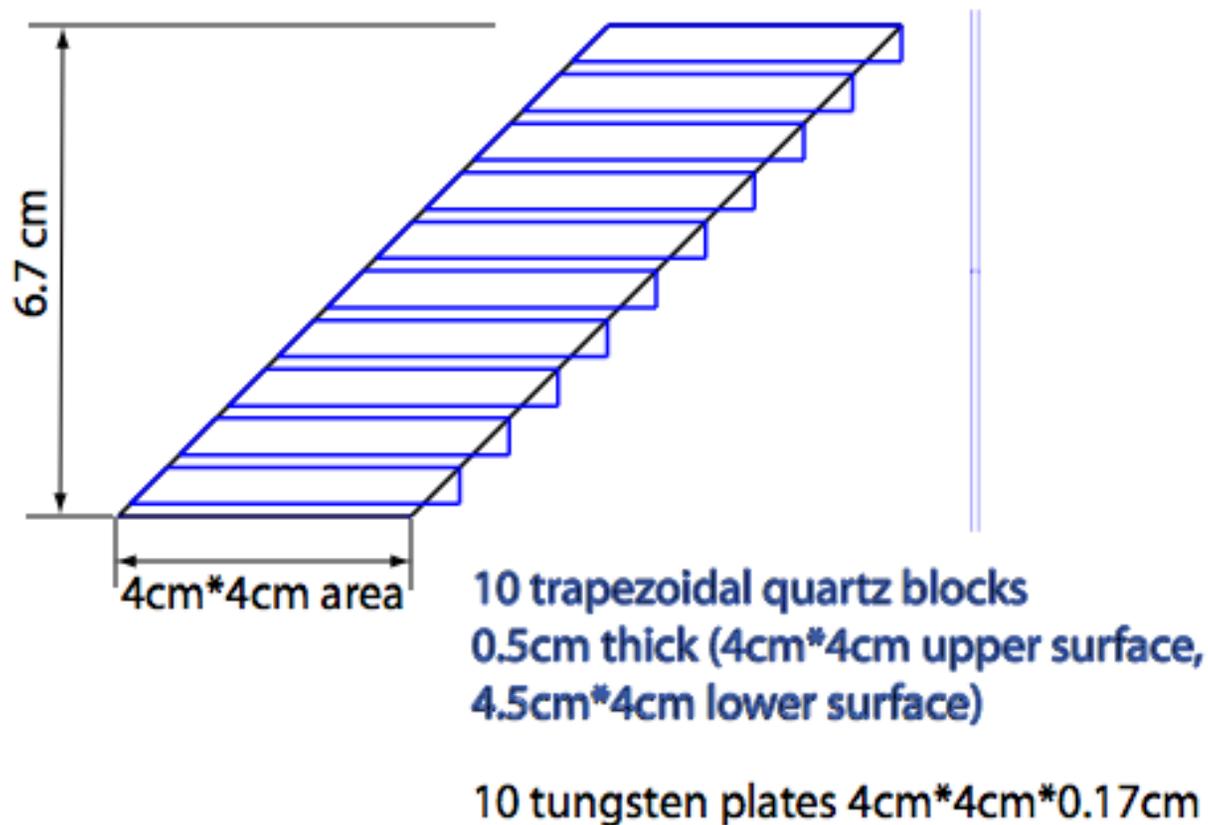

## MOLLER Showermax Development

- Benchmark new MC: Start with 2008 stack experience
  - Apply “qsim” optical MC framework to the stack
  - Try to reproduce Jan2008 data and compare with Piotr’s simulation results
- Create baseline showermax design
  - Modify stack/LG/pmt geometry for MOLLER
  - Start with Piotr’s optimal stack configuration (10 pieces: 5mm quartz, 2.4mm tungsten)
  - Apply Mainz testbeam and Peiqing’s lightguide experience
- Optimize baseline design
  - Study dependence on numbers and thicknesses of W and quartz, and energy, position and angles of incident particles
- Build prototype and test with beam (at Mainz?, SLAC)

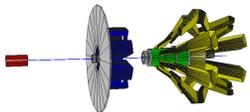

## 2008 Showermax “stack”

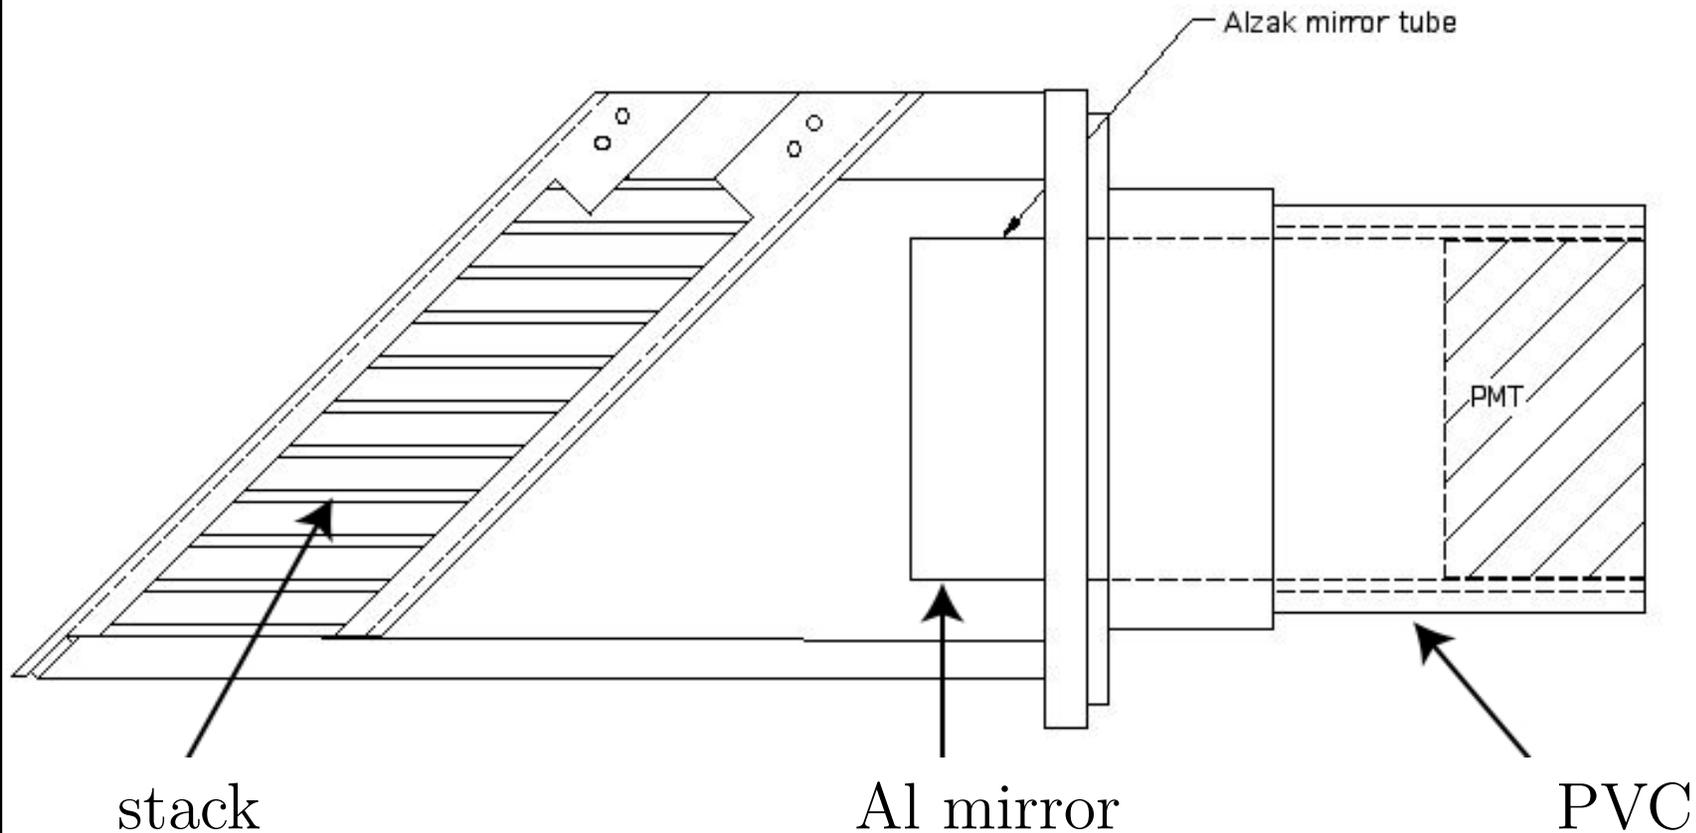

### Detector concept

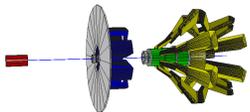

Slide from Piotr

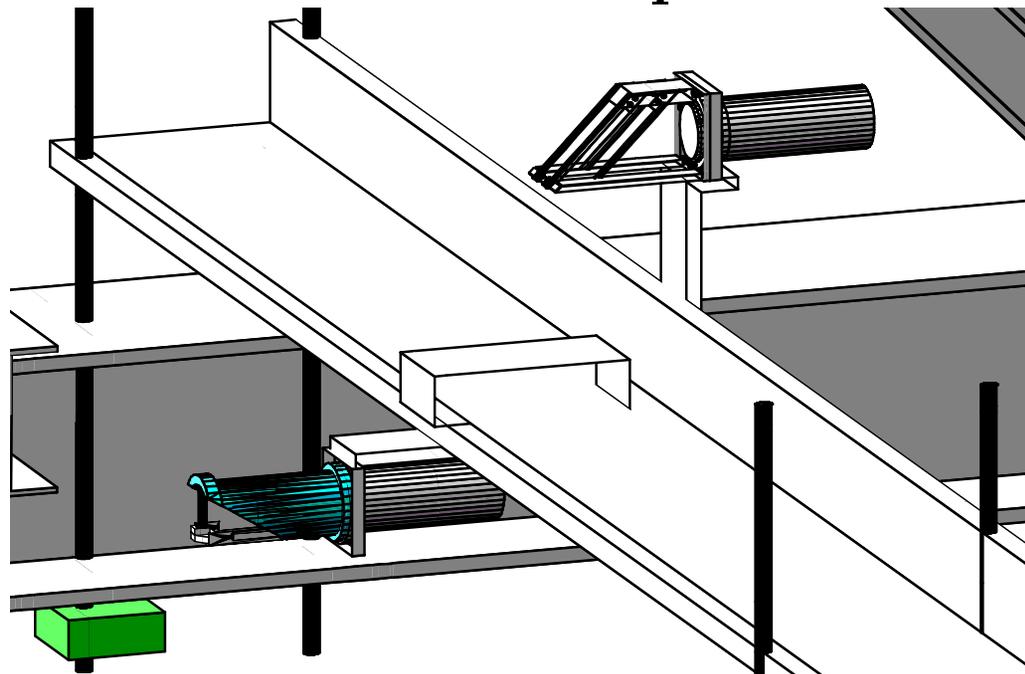

## 2008 Stack Detector Schematic

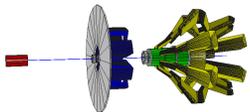

Schematic from Piotr

## Jan2008 Testbeam Setup and Conditions

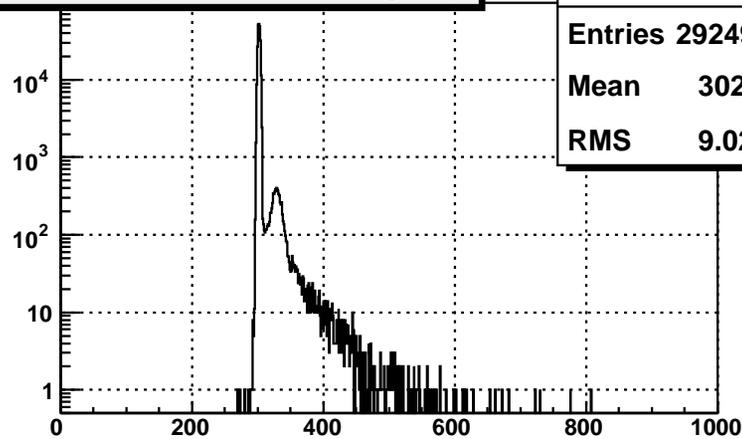

- Thin and Stack dets rigidly mounted along  $45^\circ$  angle; installed above rHRS focal plane (between VDC's and S1 scint. plane)
- $E_{\text{beam}} = 956 \text{ MeV}$ ,  $5 - 50 \mu\text{A}$ ,  $100 \text{ mg/cm}^2$  Ta target
- rHRS at  $19^\circ$ , using VDC's and s0 trigger (removable)
- Counting rates  $\sim 10 \text{ Hz}/\mu\text{A}$

# Jan2008 Testbeam Pulse Height Dists

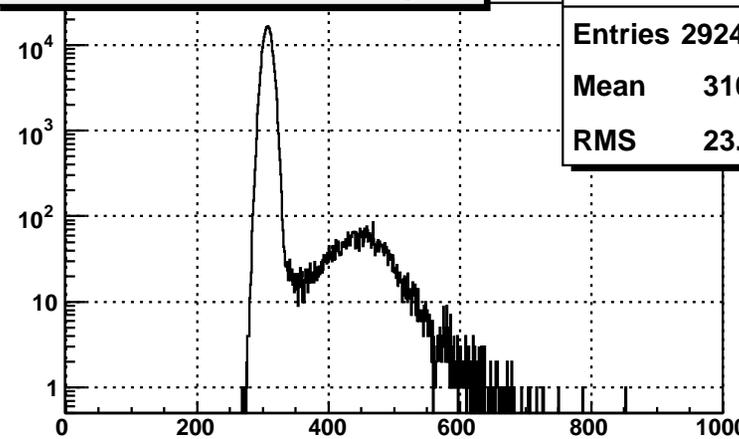

Thin Det (Raw, 3686, trig s0)

Entries	292492
Mean	310.6
RMS	23.95

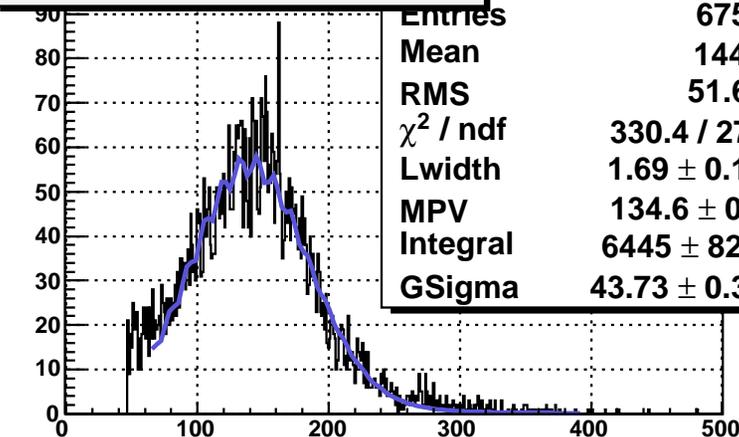

Thin Det (ped sub, 3686, trig s0)

hthin

Entries	8915
Mean	33.36
RMS	15.95
$\chi^2 / \text{ndf}$	293.2 / 76
Lwidth	$1.9 \pm 0.0$
MPV	$24.76 \pm 0.13$
Integral	$8381 \pm 102.2$
GSigma	$5.942 \pm 0.152$

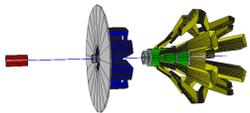

Stack Det (ped sub, 3686, trig s0)

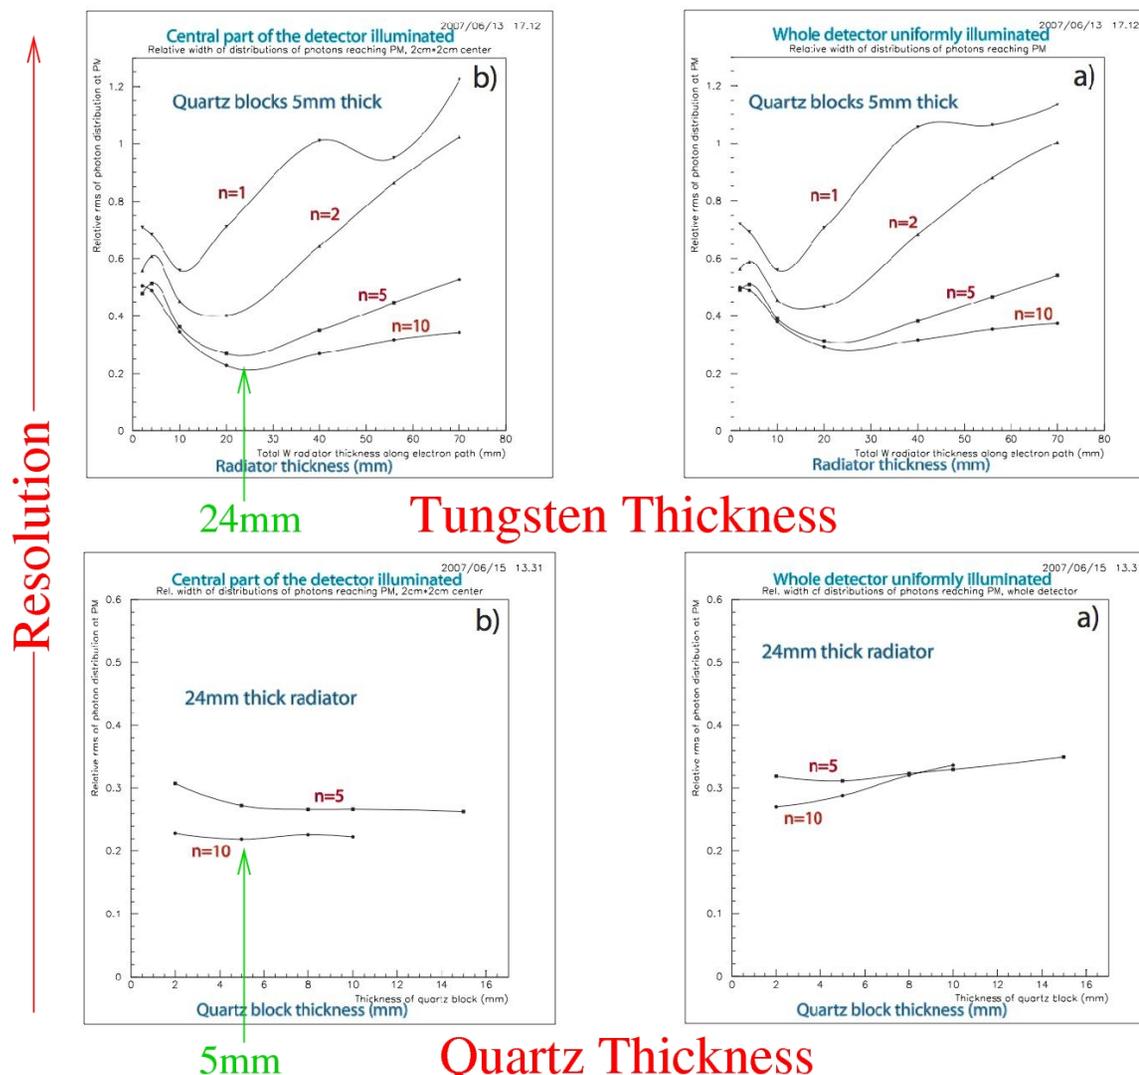

hstk

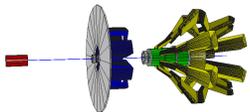

Entries	6758
Mean	144.1
RMS	51.65
$\chi^2 / \text{ndf}$	330.4 / 272
Lwidth	$1.69 \pm 0.13$
MPV	$134.6 \pm 0.3$
Integral	$6445 \pm 82.8$
GSigma	$43.73 \pm 0.36$

- Stack performance:  $51.7/144 = 0.358$  (raw)

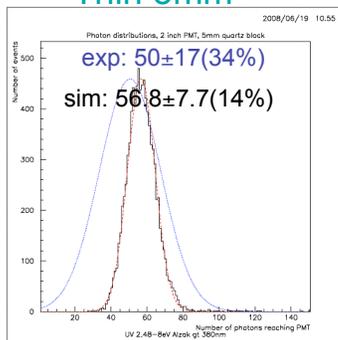

# Piotr's MC: Tungsten and Quartz thickness study (for $\sim 900\text{MeV}$ electrons)

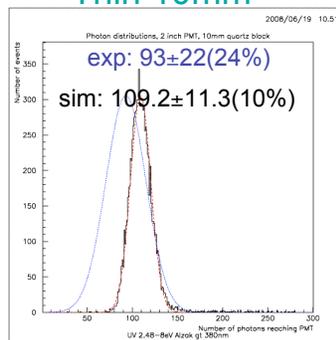

## January 2008 PREx detectors tests, comparison with simulations

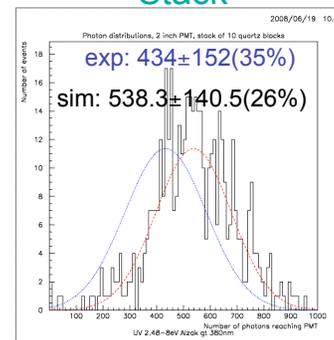

Thin 5mm

Thin 10mm

Stack

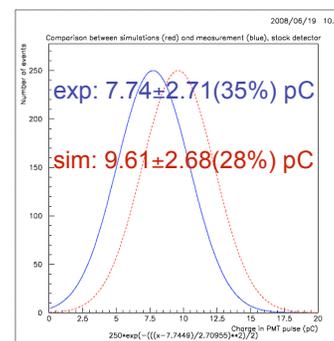

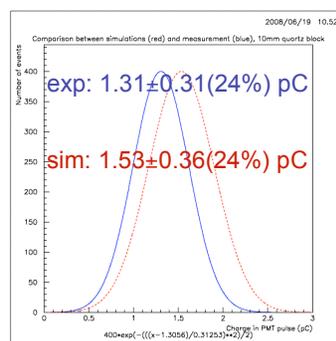

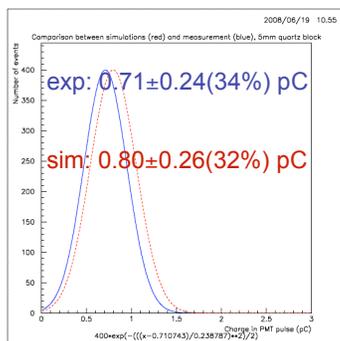

Number of Cherenkov photons reaching PM

$$N_{PE} = 0.2N_{ph} \quad (\langle QE \rangle = 0.2)$$

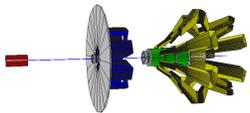

In panels below widths of gaussian fits to the simulated  $N_{ph}$  distributions (red lines) are corrected for the PMT resolution according to the formula (for the used PMTs measured value of the  $\delta q$  is 0.23):

$$\delta Q_e = \sqrt{(\delta N_{ph})^2 + \frac{1 - QE + (\delta q)^2}{N_{PE}}}$$

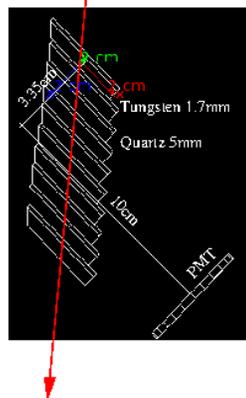

PM output charge (pC)

Entries	251277
Mean	495.3
RMS	155.5

Results:  
495 photons  
121 PEs  
32% resolution

Photo-Electron Distribution

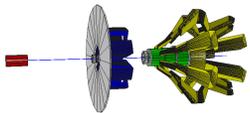

photo_electrons	
Entries	251277
Mean	120.9
RMS	39.57

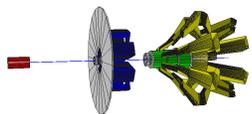

## 2008 Testbeam Data and Simulation Summary

- Results for stack detector were lack-luster: 35% relative width
  - Why?
    - Because energy too low? **probably not**
    - Or some other reasons? ...det alignment, design... **more likely**
- Both simulations give reasonable agreement with real data at 15 - 20% level
- Simulations are also in reasonable agreement with each other:
  - Piotr found 538 Cer. photons reach PMT per electron with 28% relative width
  - ISU found 495 photons with 32% rel width
  - Experiment yielded 434 photons with 35% rel. width

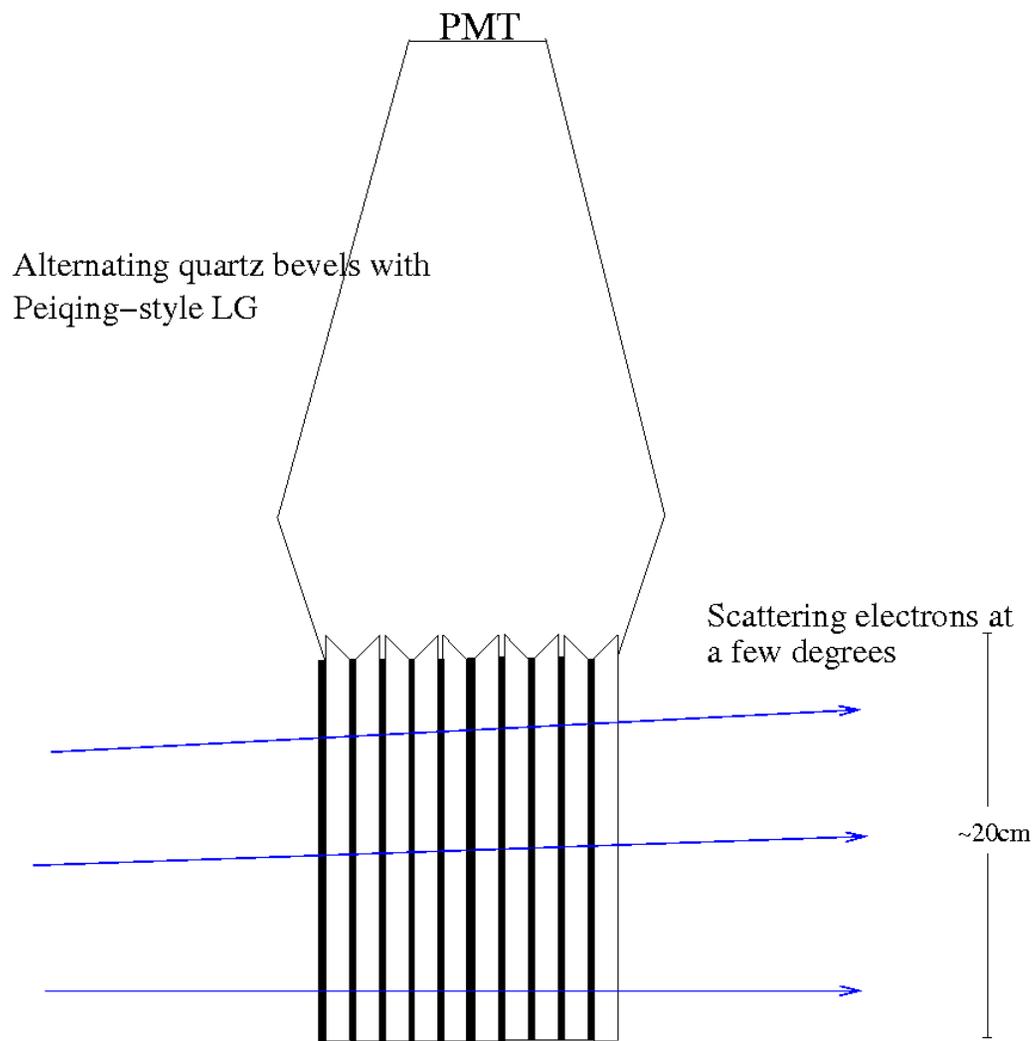

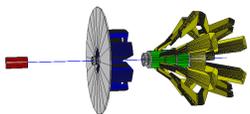

## MOLLER Showermax Development

- Benchmark new MC: Start with 2008 stack experience
  - Apply “qsim” optical MC framework to the stack
  - Try to reproduce Jan2008 data and compare with Piotr’s simulation results
- Create baseline showermax design
  - Modify stack/LG/pmt geometry for MOLLER
  - Start with Piotr’s optimal stack configuration (10 pieces: 5mm quartz, 2.4mm tungsten)
  - Apply Mainz testbeam and Peiqing’s lightguide experience
- Optimize baseline design
  - Study dependence on numbers and thicknesses of W and quartz, and energy, position and angles of incident particles
- Build prototype and test with beam (at Mainz?, SLAC)

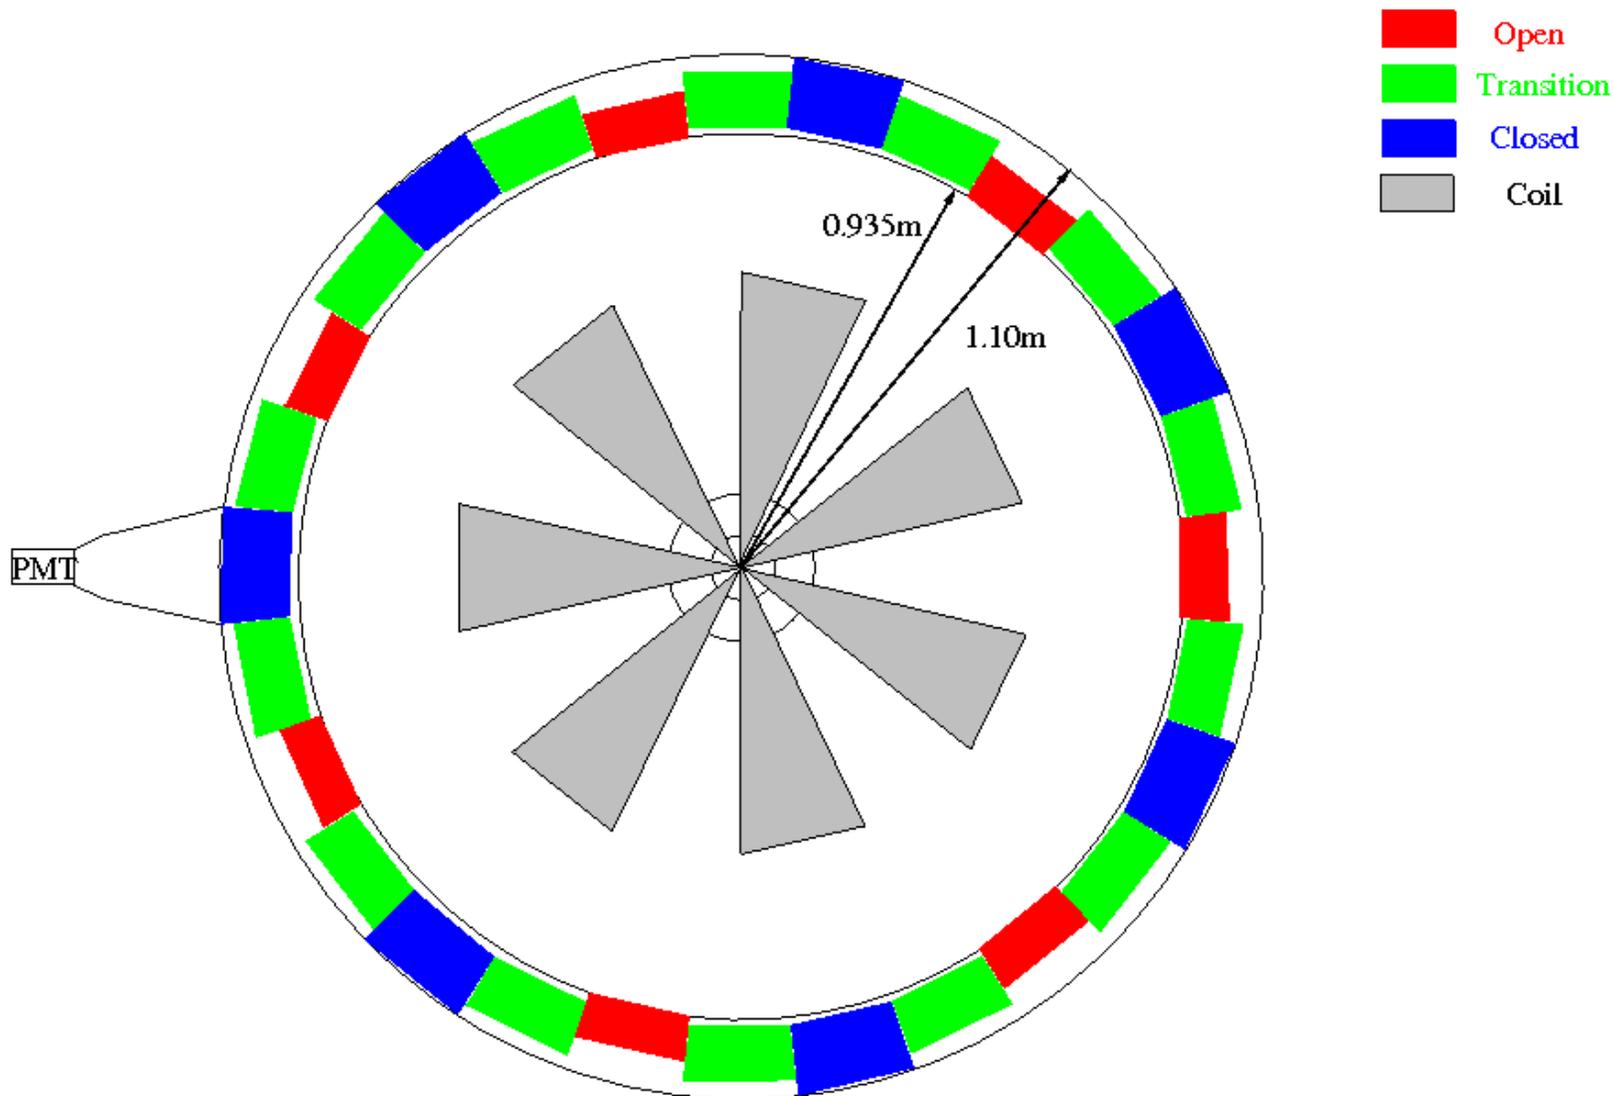

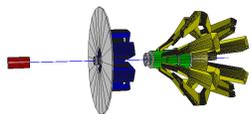

# Crude Sketch of MOLLER Showermax Concept

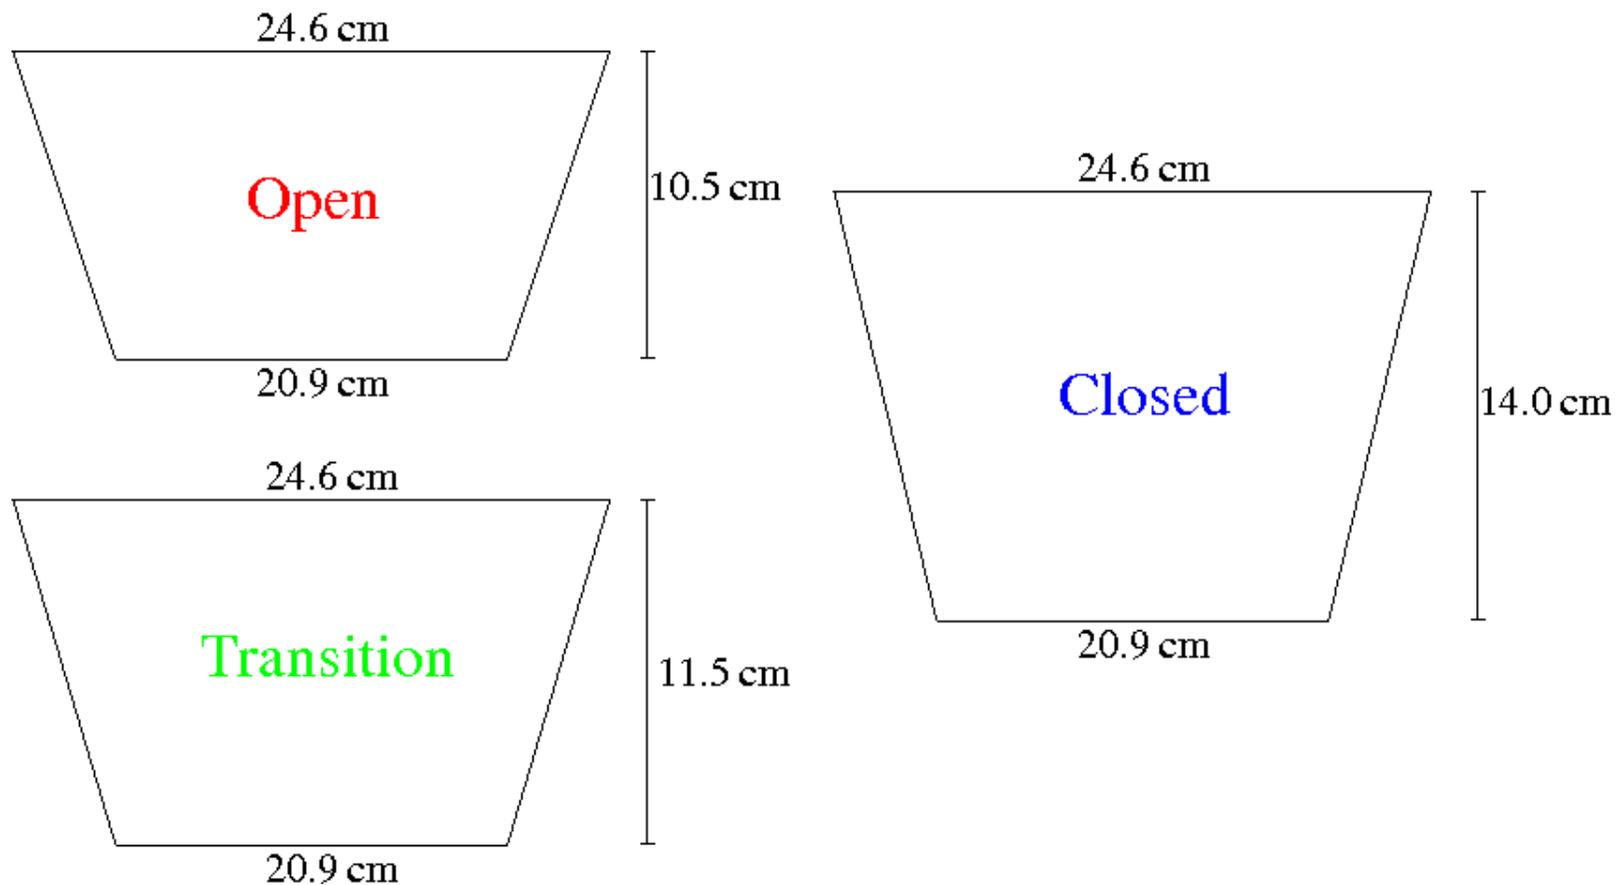

# Showermax Detector Ring

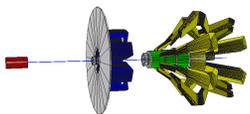

# Showermax Quartz

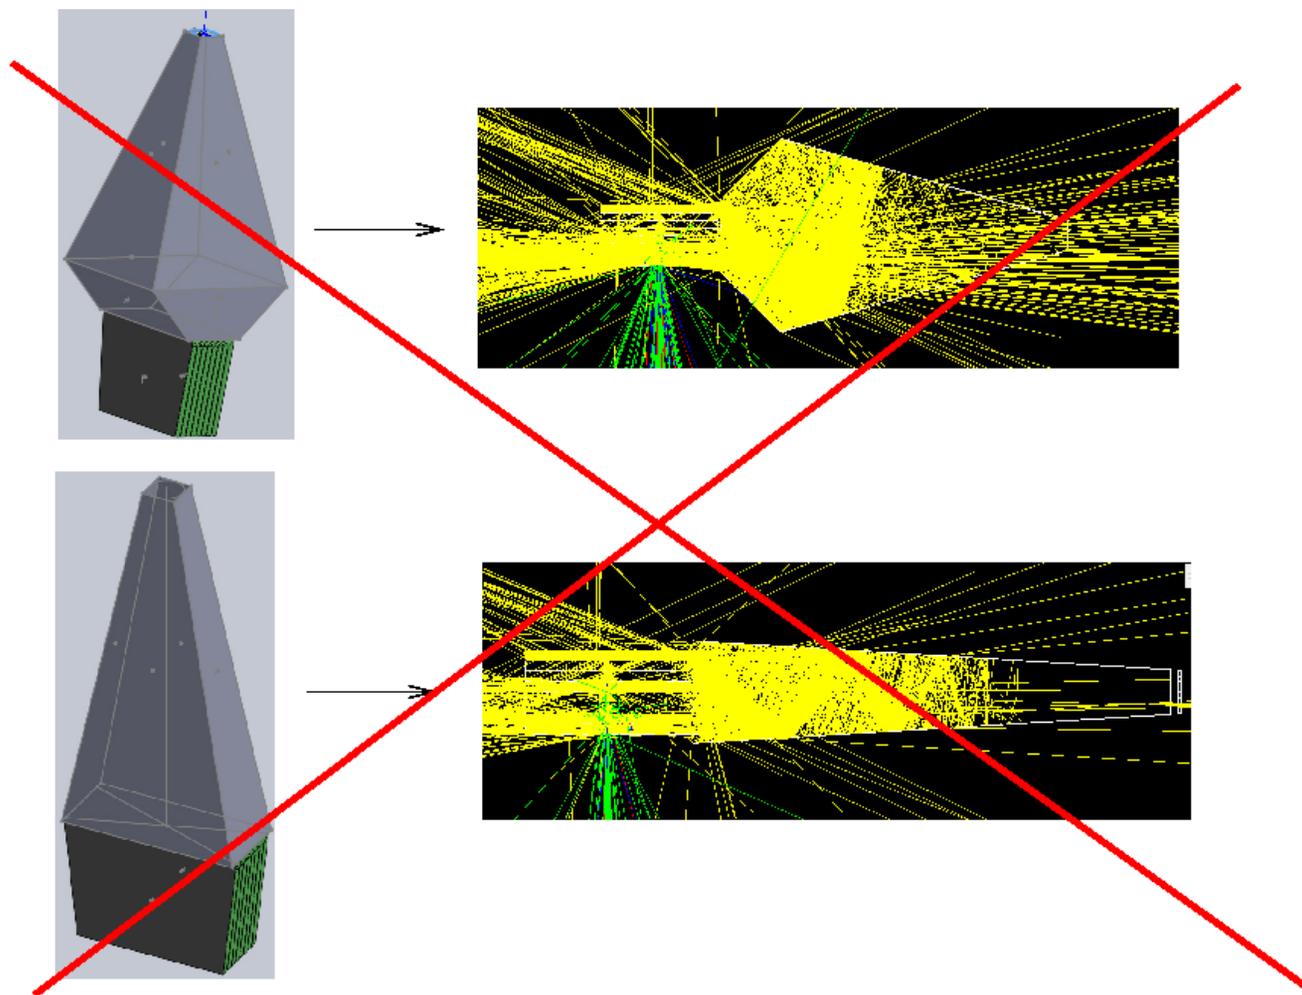

Spectrosil 2000

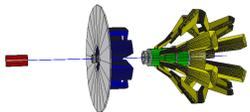

each piece has single 45 deg bevel across long end

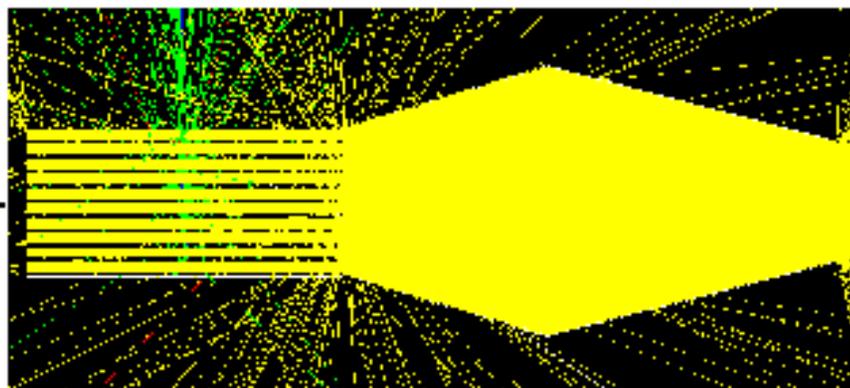

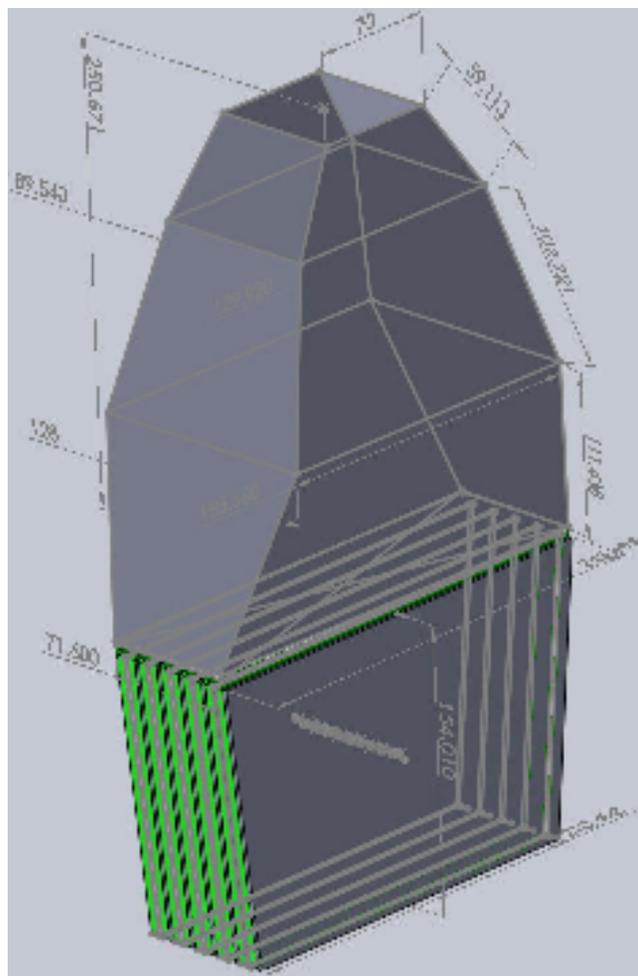

## Showermax Lightguide (Bad Examples)

\*Lightguide design non-trivial and perhaps most important feature

## Showermax Lightguide (Good)

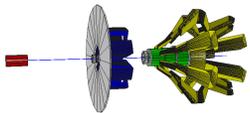

10 pieces of quartz (5mm thick)

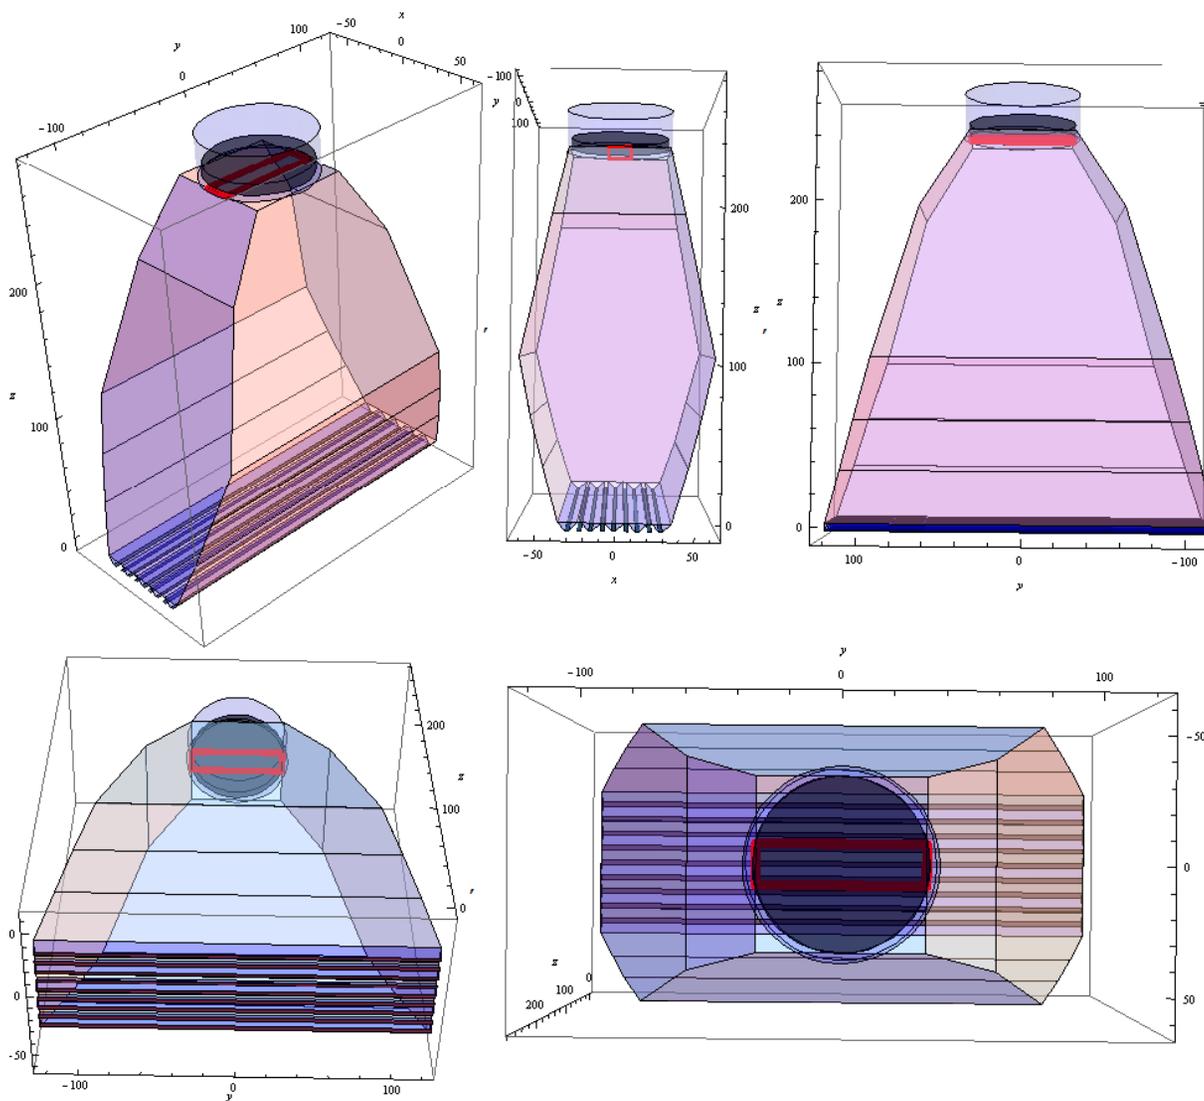

10 pieces of W (2.4mm thick)

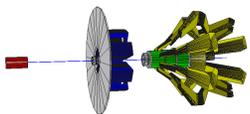

$$0.41 + 6.8 = 7.2 X_0$$

Using 3" PMT

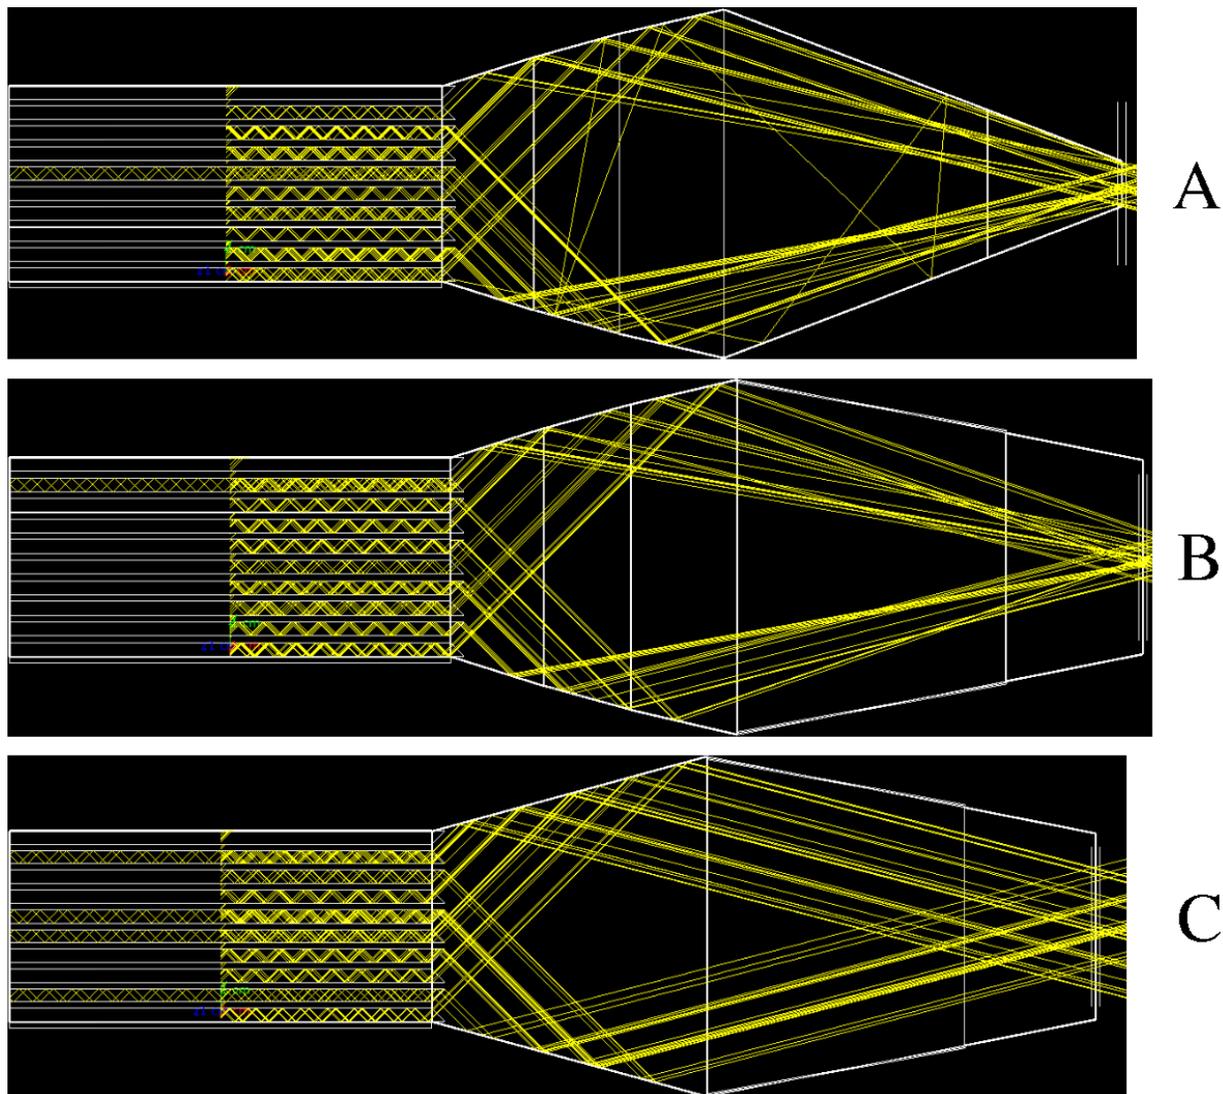

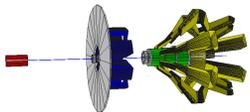

# Showermax Lightguide Development

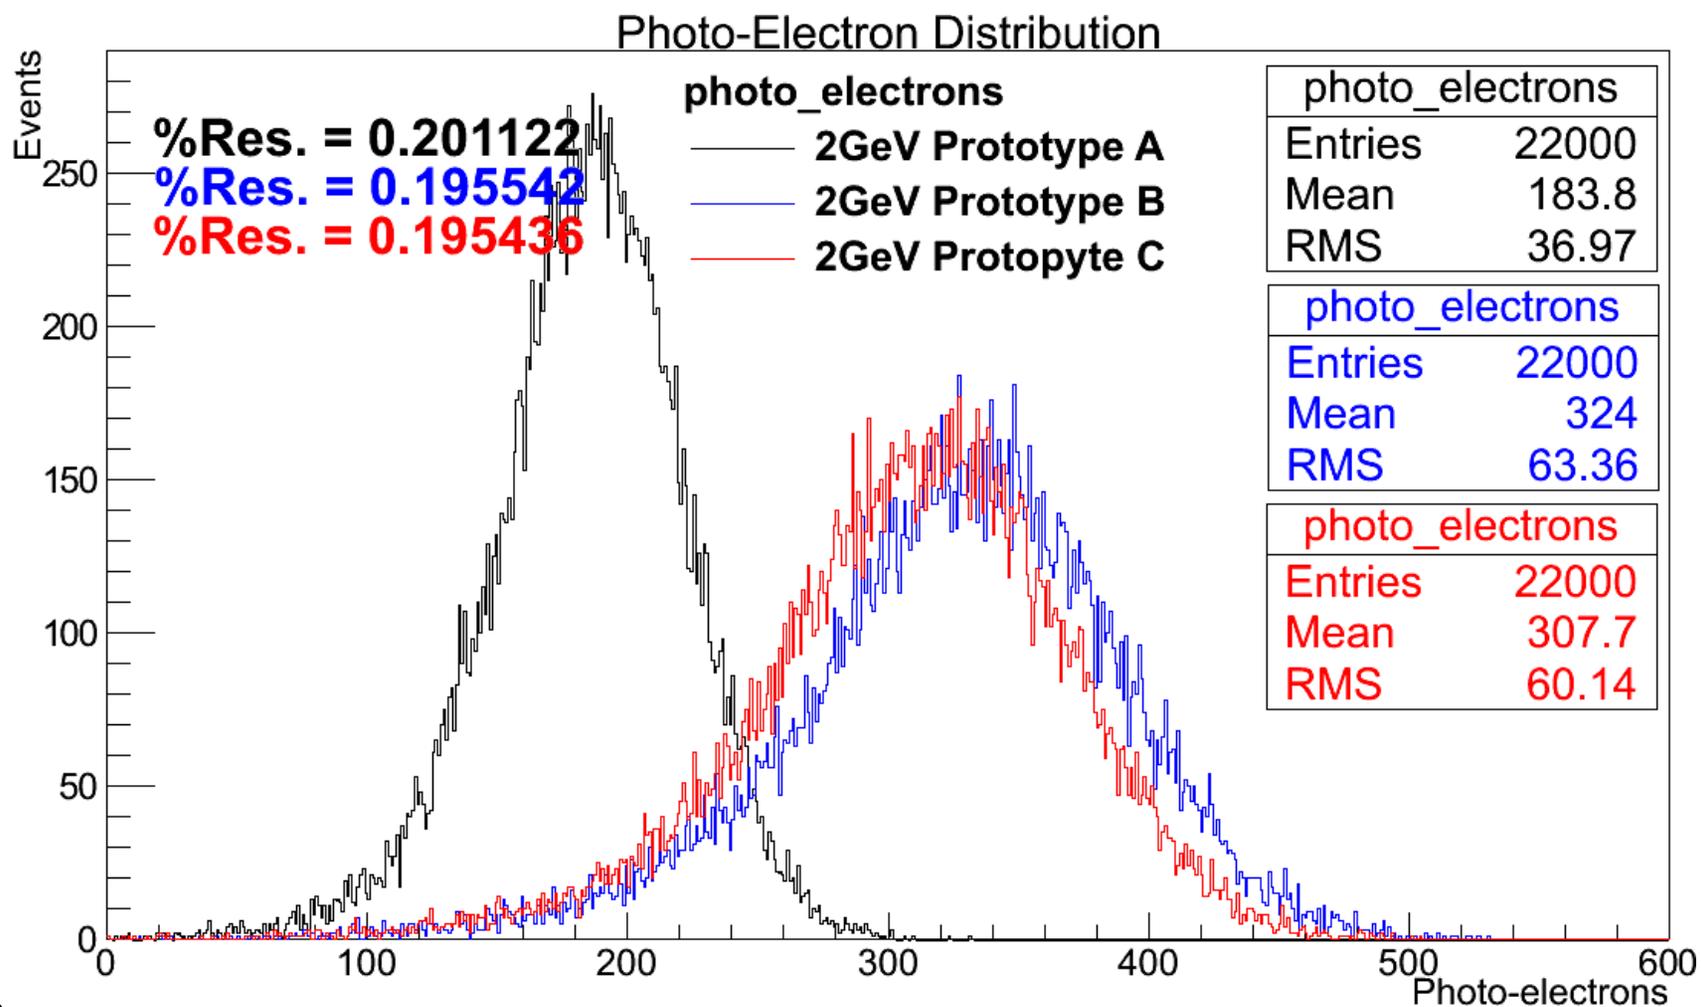

# Showermax Lightguide Development

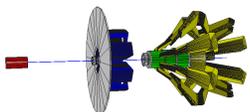

# Showermax MC LG Study

- 2 GeV electron beam centered on quartz face; normal incidence

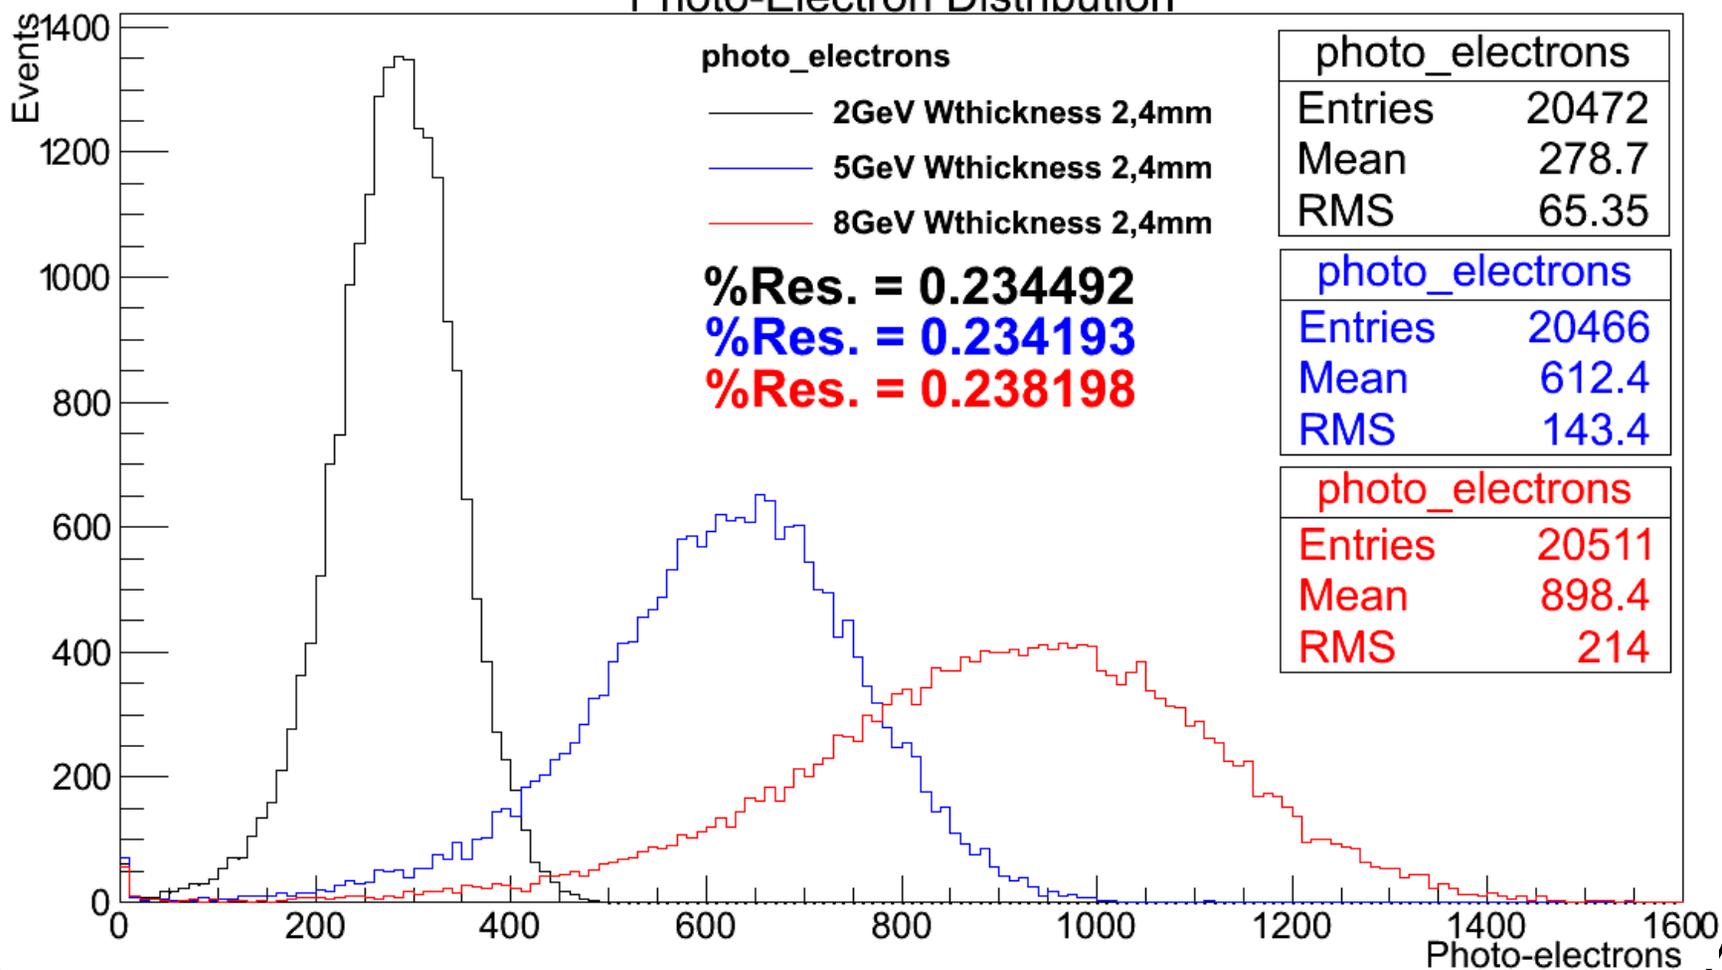

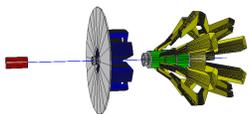

# Baseline Showermax MC Results: Lightguide C

- 2, 5, and 8 GeV  $e^-$  uniformly sampled over quartz face; normal

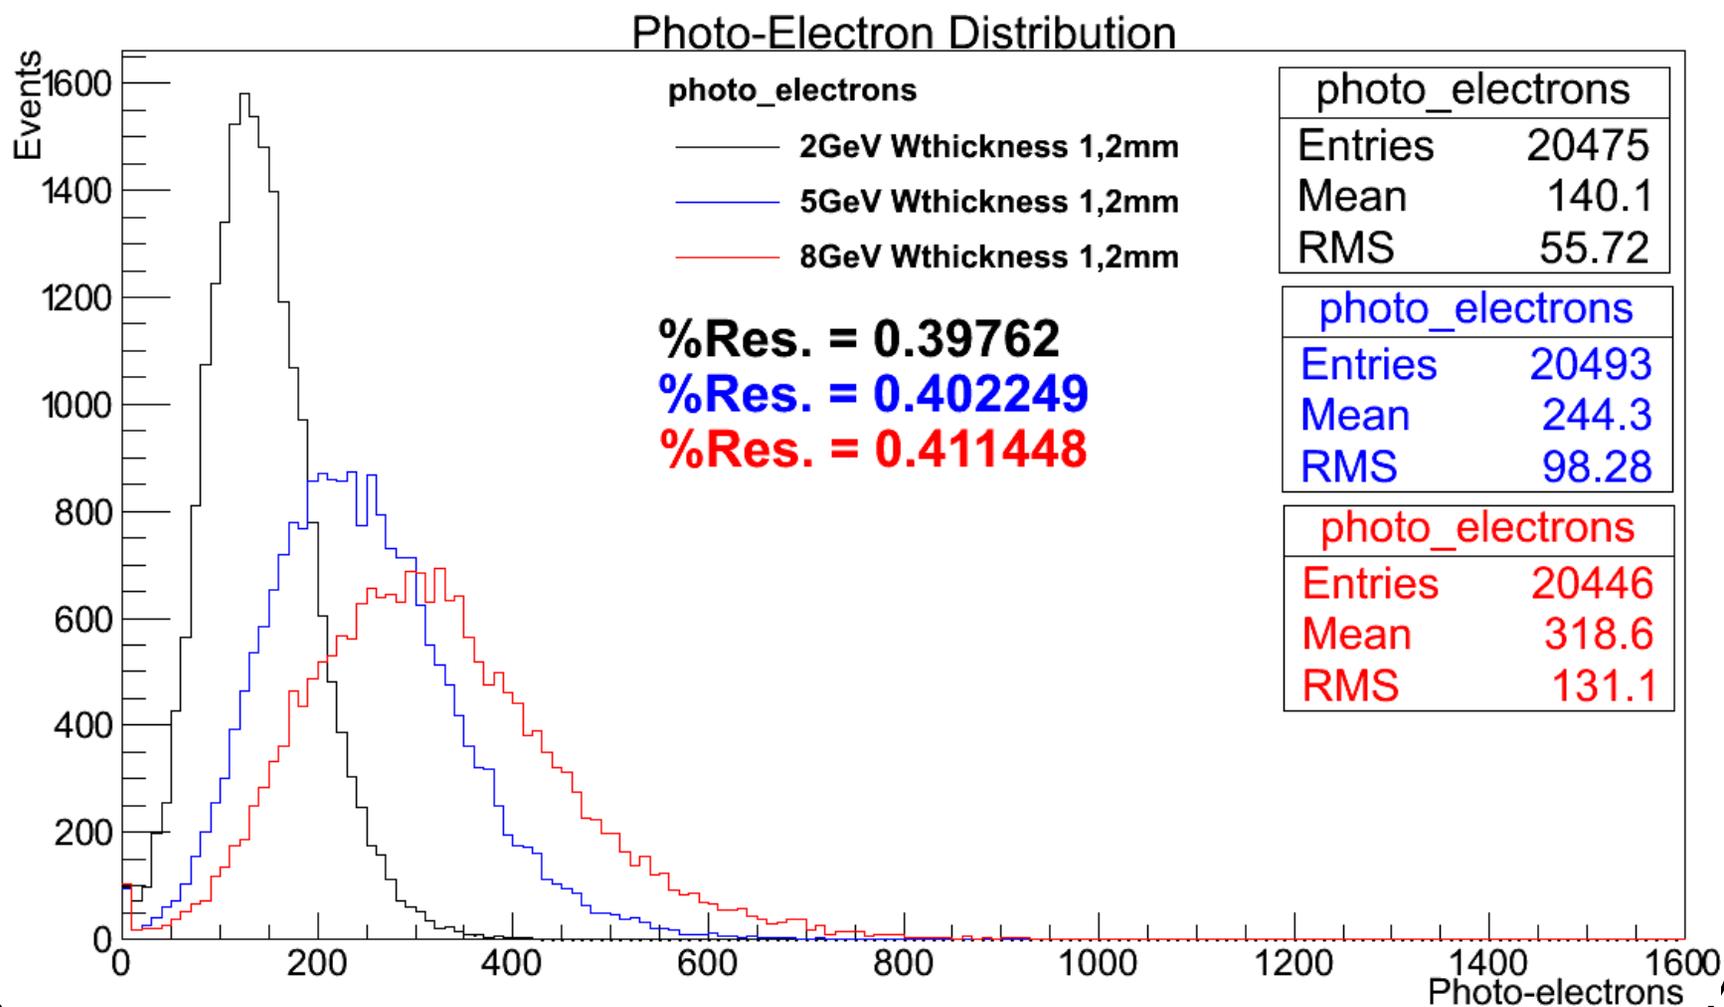

Photo-Electron Distribution

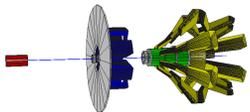

## What if thickness of W is halved?

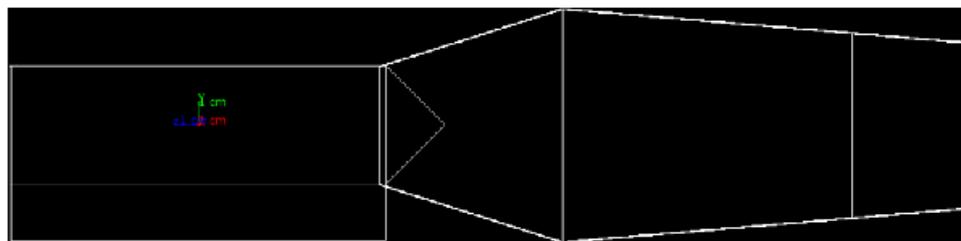

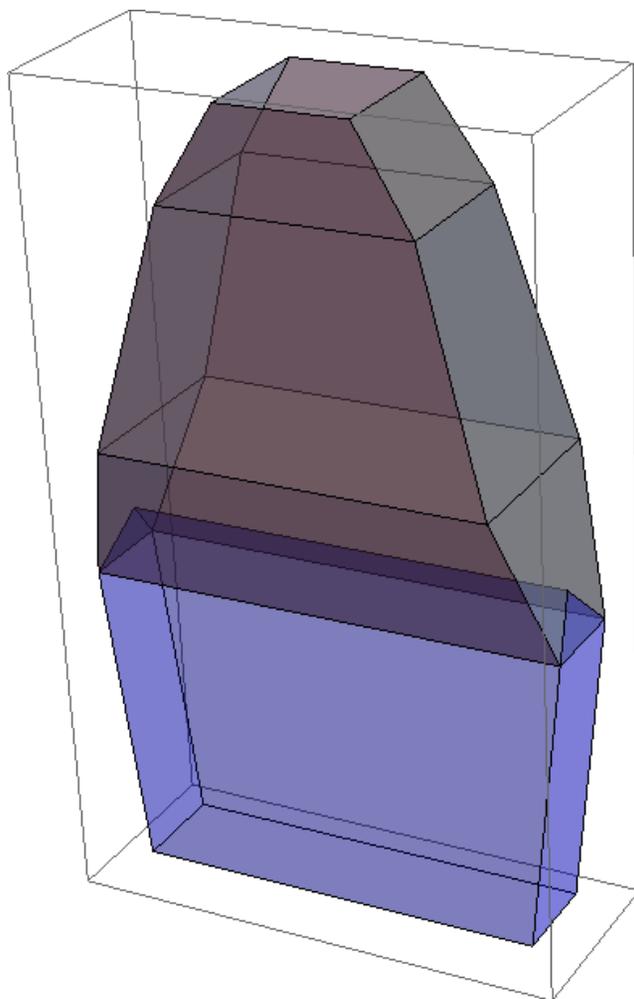

- 2, 5, and 8 GeV  $e^-$  uniformly sampled over quartz face; normal

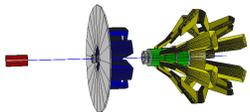

What if just use single piece of W and Quartz?

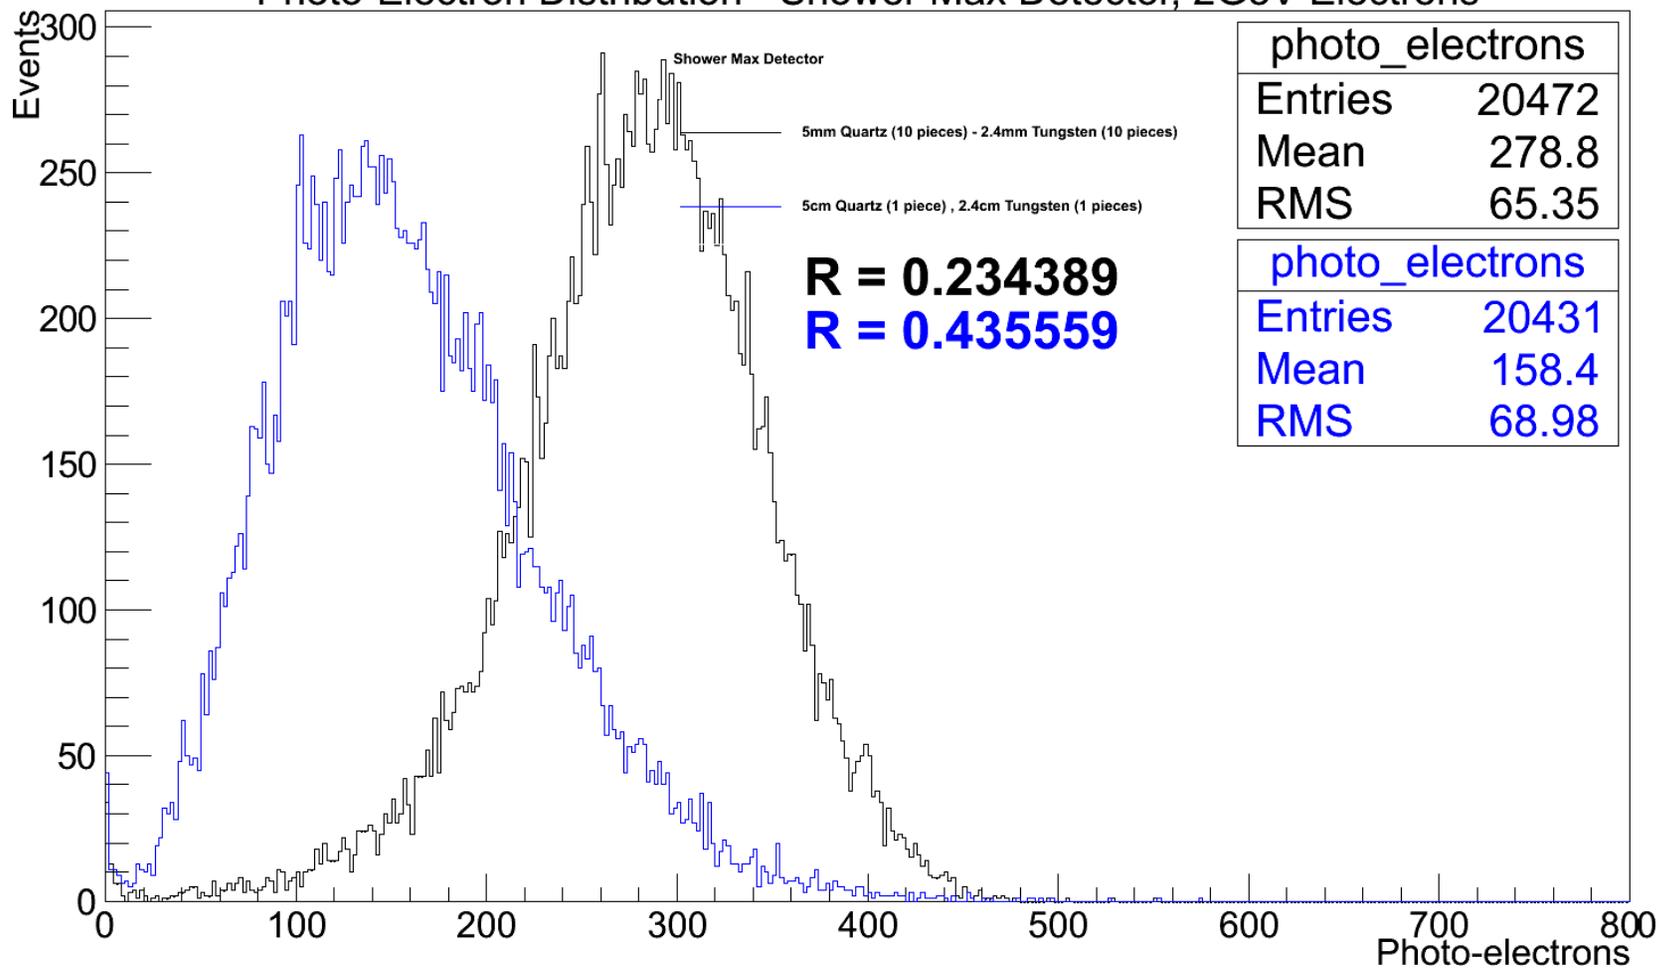

Answer: Doesn't work well at low energy (but way cheaper!)

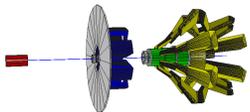

# Single piece Design versus Baseline Design at 2GeV

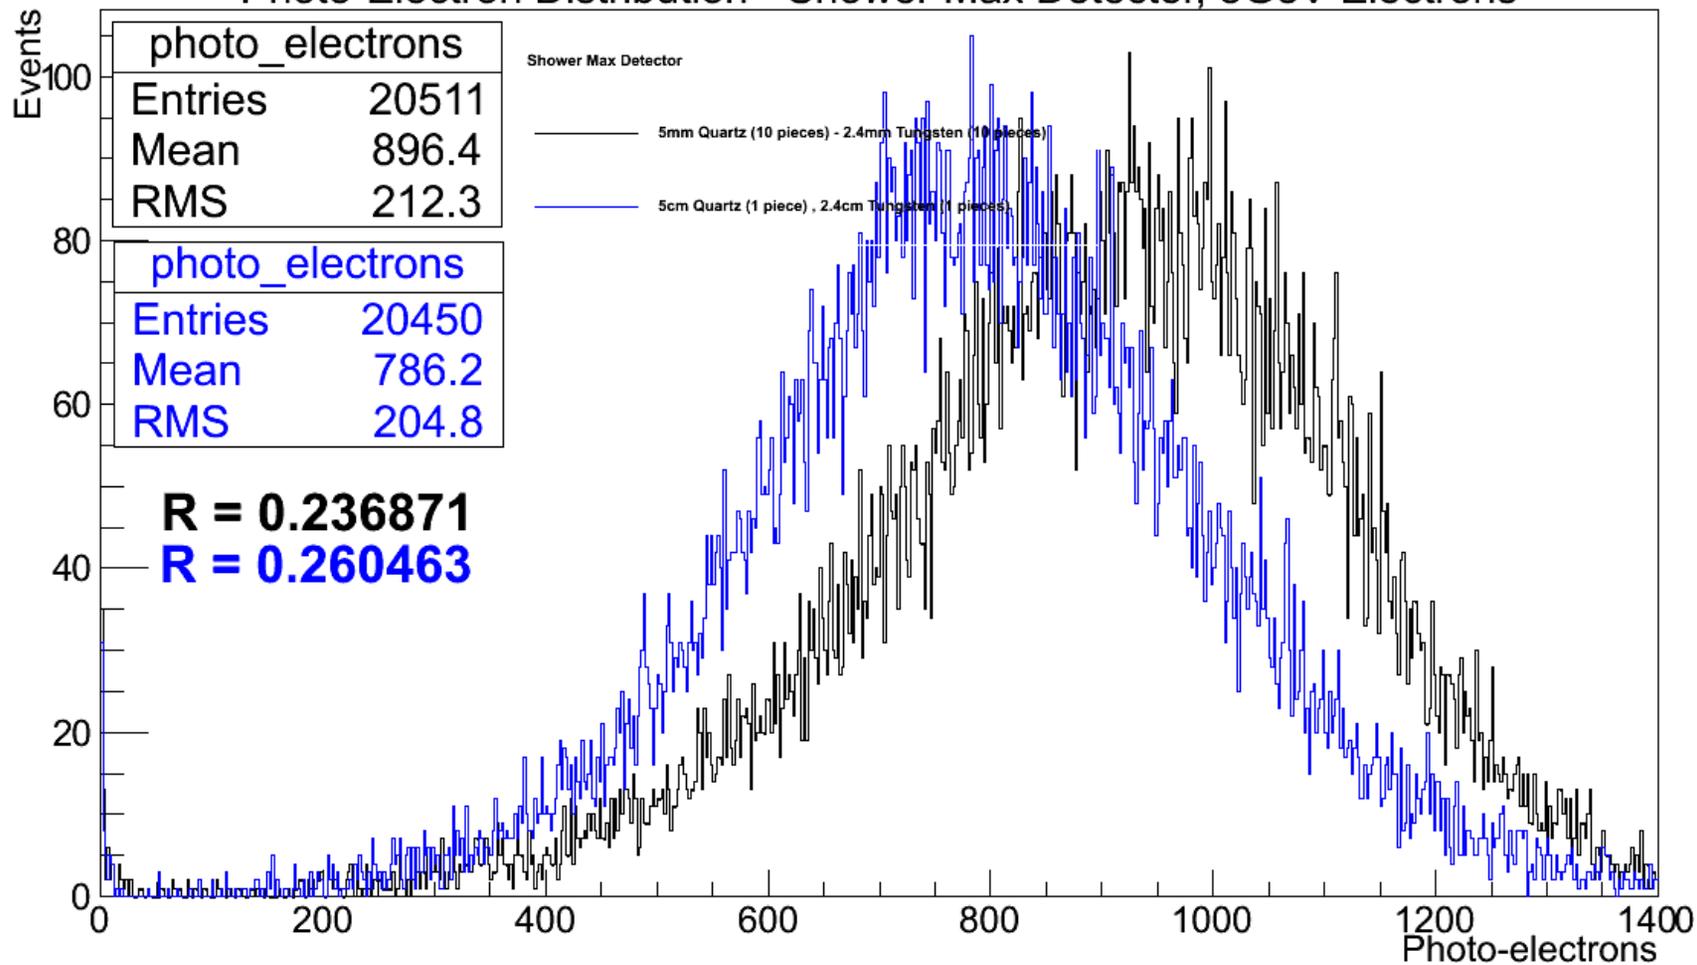

Photo-Electron Distribution - Shower Max Detector, 2GeV Electrons

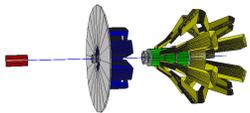

# Single piece Design versus Baseline Design at 8GeV

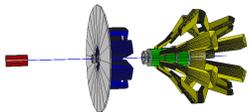

Photo-Electron Distribution - Shower Max Detector, 8GeV Electrons

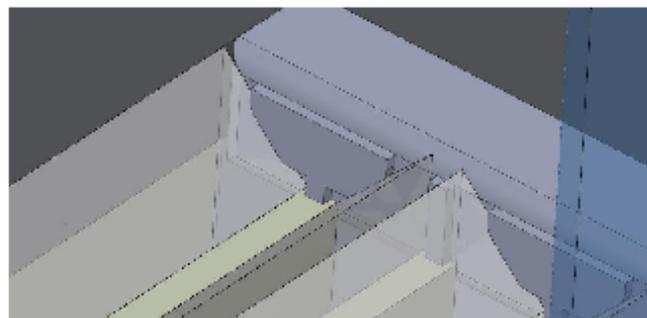

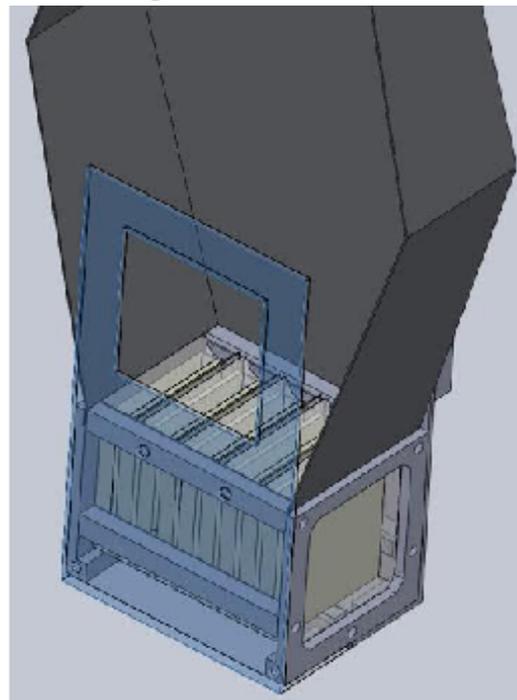

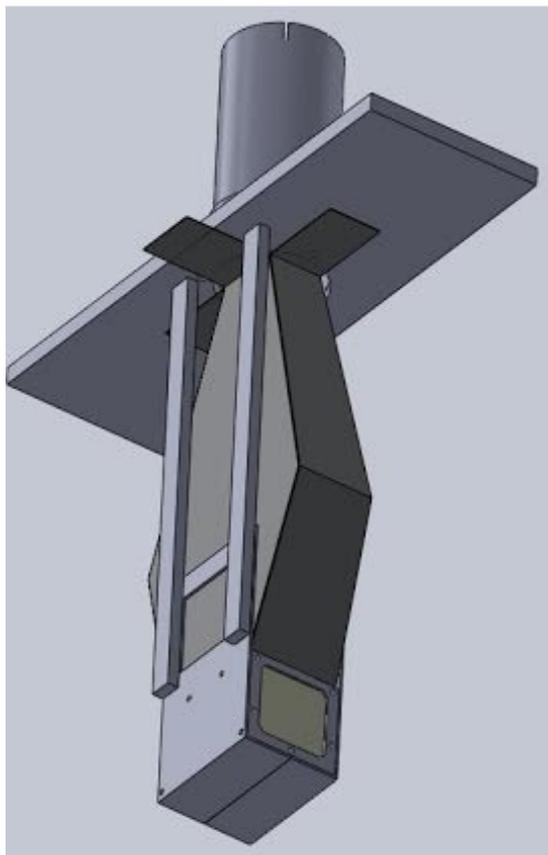

## MOLLER Showermax Development

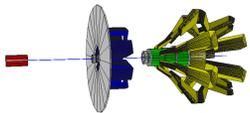

- Benchmark new MC: Start with 2008 stack experience
  - Apply “qsim” optical MC framework to the stack
  - Try to reproduce Jan2008 data and compare with Piotr’s simulation results
- Create baseline showermax design
  - Modify stack/LG/pmt geometry for MOLLER
  - Start with Piotr’s optimal stack configuration (10 pieces: 5mm quartz, 2.4mm tungsten)
  - Apply Mainz testbeam and Peiqing’s lightguide experience
- Optimize baseline design
  - Study dependence on numbers and thicknesses of W and quartz, and energy, position and angles of incident particles
- Build prototype and test with beam (at Mainz?, SLAC)

## Prel. Prototype design using 2008 Stack pieces

- MC studies needed to understand potential benefits of beamtest

## Summary and Future Work

- Optical MC framework for showermax R&D established
  - Reasonable/good agreement with 2008 beamtest data and Piotr's simulations
- Baseline MOLLER showermax detector design established
  - Gives strong energy dependent light yields with  $\sim 25\%$  relative width
- Optimization of baseline design underway
- Build prototype based on optimized design and test with beam
- Other questions/considerations:
  - $90^\circ$  LG or  $135^\circ$  (or  $45^\circ$ ) LG (Need to decide)
  - Need to worry about sensitivity to neutrons, pions
  - PE uniformity/edge effects due to transv. shower leakage
  - Stray electrons, splashback,...Need optical MC in remoll
