April 21, 2017

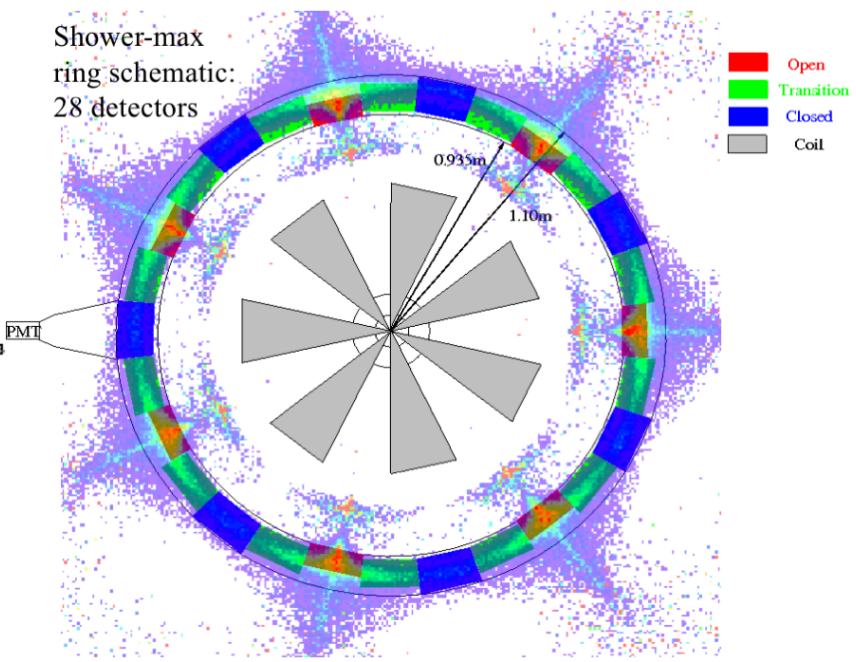

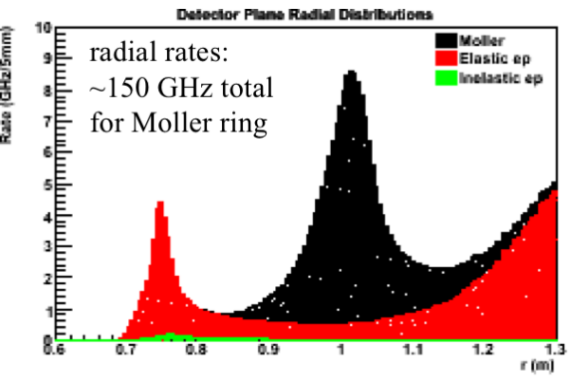

Motivation & Requirements

- Provides additional measurement of e-e ring integrated flux
- Weights flux by energy \Rightarrow less sensitive to low energy and hadronic backgrounds
- Will also operate in tracking mode to give additional handle on background (pion) identification – gives MIP signal
- Should have good resolution over full energy range ($\frac{\sigma}{\langle n \rangle} \lesssim 25\%$), long term stability and be radiation hard

Shower-max phi-segmentation, rates and energies

- Large range of rates and energies for different phi-region detectors:
 - Open ~9 GHz/det; 2 - 9 GeV, peak at 7 GeV...
 - Closed ~3.5 GHz/det; 2 - 5 GeV, peak at ~3 GeV
 - Transition ~4.5 GHz/det; 2 - 7 GeV, 3 - 5 GeV plateau

Baseline Shower-max Design: 4-layer Stack

- Detector concept uses a layered “stack” of tungsten and fused silica (quartz) to induce EM showering and produce Cherenkov light
- “Baseline” design developed using GEANT4 optical MC simulation:
 - Current design uses a 4-layer stack with 6mm tungsten and 12.5mm quartz pieces
 - Cherenkov light directed to 3inch PMT using air-core, aluminum light guide

4-layer Stack: 6mm thick tungsten (dark grey), interleaved with 12.5mm thick quartz (white)

alternating quartz bevel design

single-bounce mirror: “funnel” angle and length optimized

“Baseline” Design (side view)

Materials (all rad-hard):

- Tungsten is high purity (99.95%) and quartz is optically polished Spectrosil 2000
- Light guides are aluminum specular reflectors (Miro-silver 27, Anolux, or al. mylar, ...)
- Total radiation length: $6.8 X_0$ tungsten + $0.4 X_0$ quartz = $7.2 X_0$

Monte Carlo tuning and Shower-max Simulations

- Quartz optical G4 properties benchmarked at MAMI: Glisur ground polish parameter ~ 0.981

MAMI testbeam with PREX detector

G4 event visualization for PREX detector

PE dists: *Real data* vs. *Sim data*

- Stack configuration MC study:
 - ❖ Stack thicknesses all same ($7.2 X_0$)
 - ❖ 2, 5, and 8 GeV incident electrons
 - ❖ PE dists generated using tuned polish parameter and 60% LG reflectivity

Conclusion:

4-layer gives comparable performance to 10-layer (and is much cheaper to build)

Shower-max event visualizations

Light guide reflectivity measurements

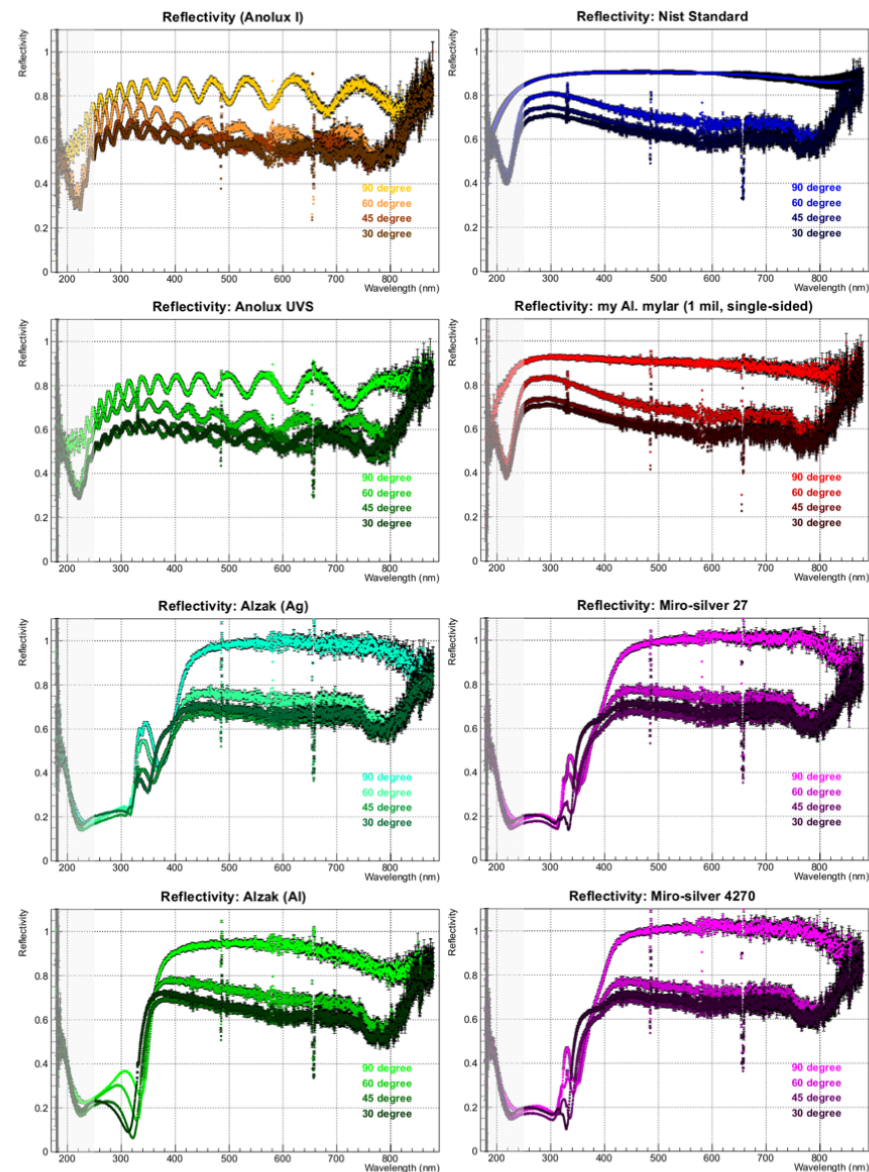

- Measuring light guide (LG) reflectivity as function of angle (10 – 90°) and λ (200 – 800nm); ongoing

- Light source: Ocean Optics DH2000: 200 - 800nm, 25W Deuterium bulb
- Spectrometer: Ocean Optics USB Flame, enhanced sensitivity, UV-VIS grating
- NIST specular calibration standard

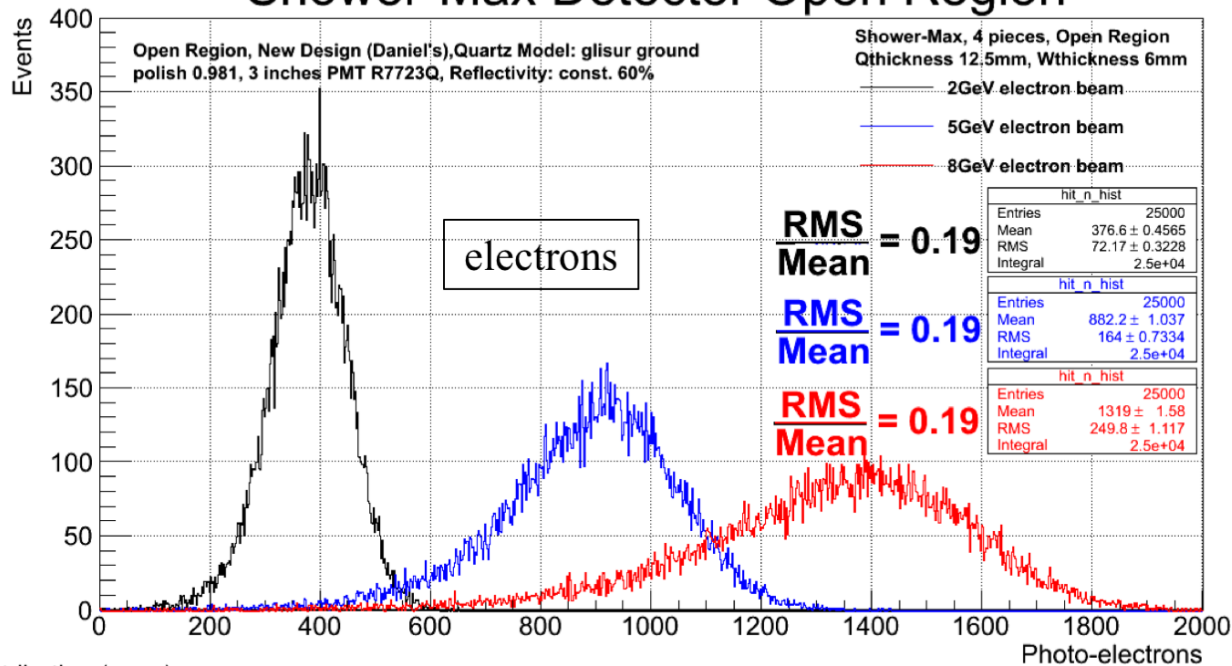

Light guide materials tested:

- | | |
|-----------------------|--------------------------------------|
| Miro-silver 4270 | Miro-silver 27 |
| Anolux I and UVS | Alzak-Al and Alzak-Ag |
| Miro 2000Ag (diffuse) | 1 mil, single-sided aluminized mylar |

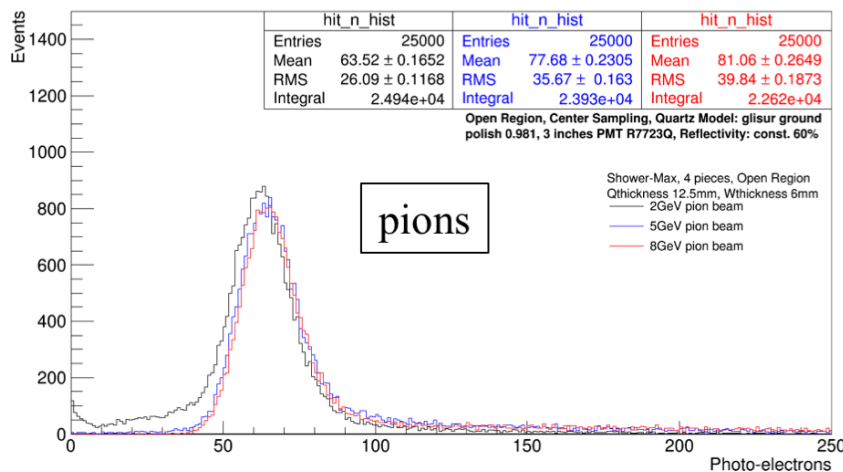

Reflectivity vs. λ for various materials at diff. angles

4-layer baseline PE Dists for 2, 5, and 8 GeV Photo-Electron Distribution Shower-Max Detector Open Region

Showermax Photo-Electron Distribution (open)

- Healthy ~65 peak-PE signal for pion tagging during tracking mode operation

Prototype build/test plans and ring concept

"Baseline"
 Costs: Total w/ spares
 quartz: \$150k (Heraeus)
 tungsten: \$60k
 alum.: \$10k (machined)
 grand total: \$220k
Weights of each assembly:
 Open: 39.7 lbs.
 Transition: 42.5 lbs.
 Closed: 50.8 lbs.
 ring weight: 1230 lbs.

- Engineered shop drawings and Prototype CADs in hand
- Will finalize prototype Stack designs this winter, construct in spring/summer and test using 8 GeV electron testbeam at SLAC
- Shower-max ring design concept: staggered in \hat{z} with reinforced struts and brackets. 28 detectors in ring: 7 Open, 7 Closed, and 14 Transition

Summary and future work

- MOLLER Shower-max baseline detector design developed
 - Meets requirement criteria: linear energy-dependent yields with good resolution; constructed with rad-hard materials
- G4 Monte Carlo work ongoing:
 - Continue to study/optimize Stack configurations
 - Study det. res. uniformity over entire face; edge effects
 - Sample realistic e^- energy and position (and angle)
 - Determine shower-max excess noise for statistical power
 - Benchmark G4 MC for shower-max: start with MAMI SAM+W data at ~ 1 GeV (all we have right now)
 - Incorporate LG reflectivity lookup tables; using 60%
- Pre-R&D funds in place for prototyping and test at SLAC?

Excess Noise for Shower-max (OPEN Septant)

PE Distribution: Showermax Open - 8mm W

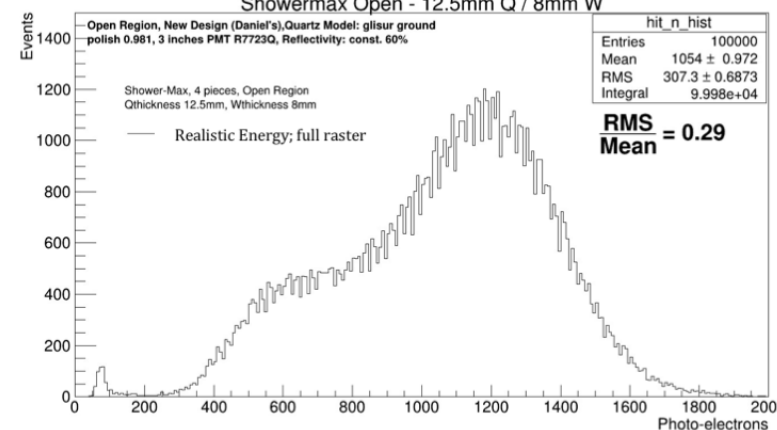

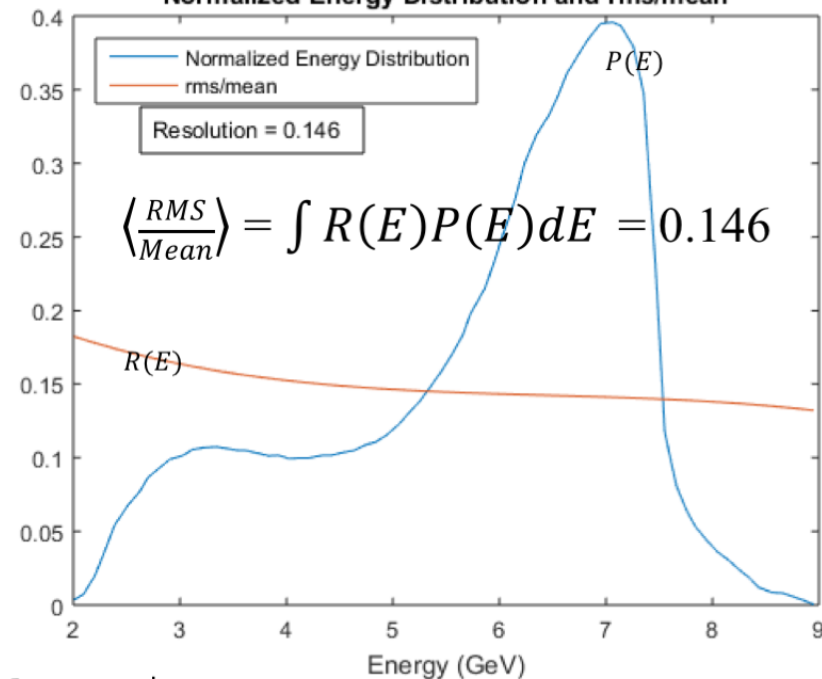

Photo-Electron Distribution Showermax Open - 12.5mm Q / 8mm W

Resolution vs. Energy

Normalized Energy Distribution and rms/mean

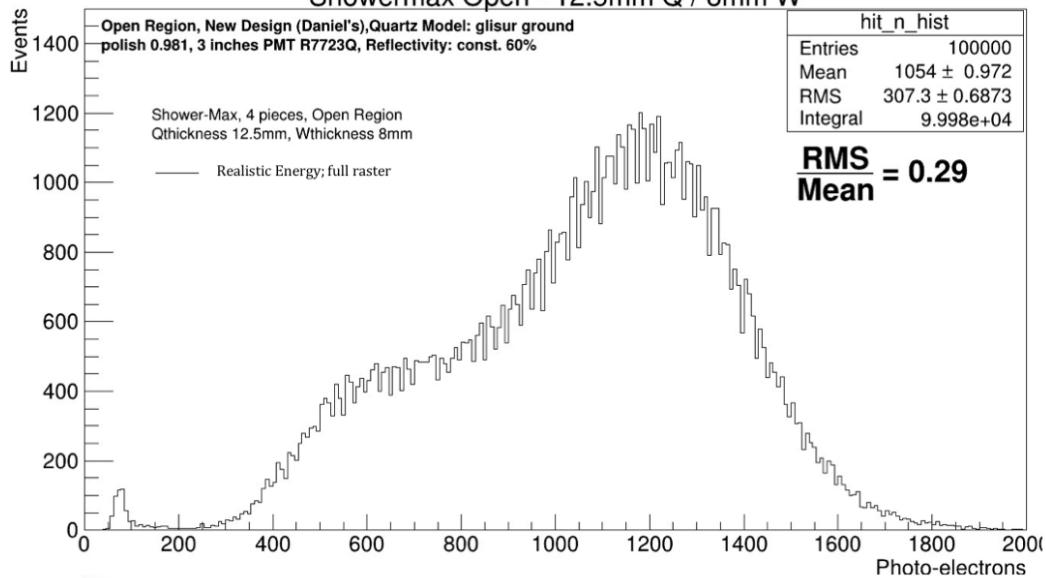

$$\diamond \text{ Excess Noise} = \sqrt{1 + \left\langle \frac{RMS}{Mean} \right\rangle^2} - 1 = 1.06\%$$

Much better than needed! Can reduce layer thicknesses and save \$

Shower-max Response Uniformity (along $\hat{\phi}$)

Photo-Electron Distribution
Showermax Open - 12.5mm Q / 8mm W

Overall RMS/Mean vs. Horizontal Position (along phi)

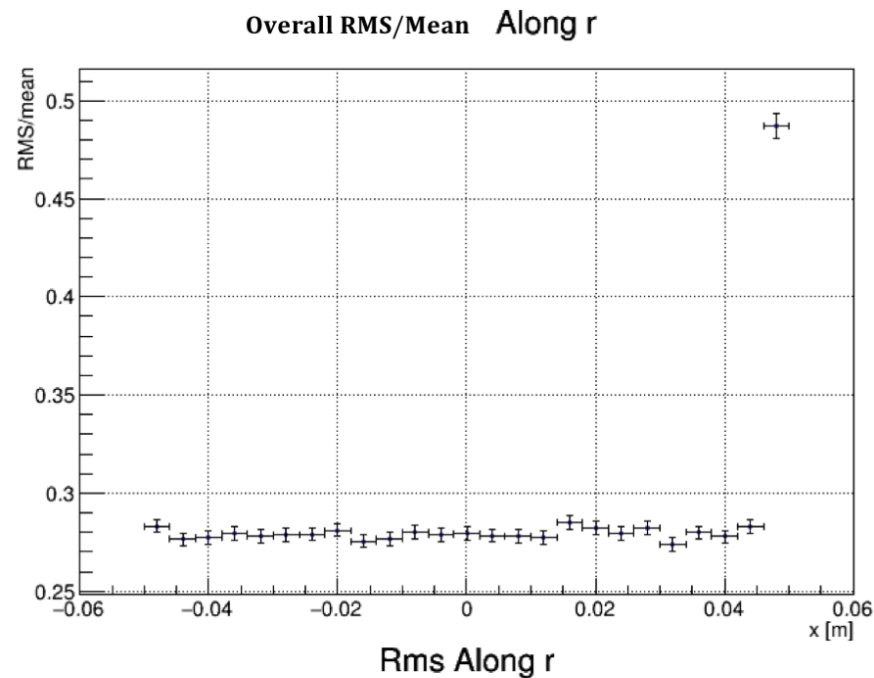

Mean vs. Horizontal Position (along phi)

Rms vs. Horizontal Position (along phi)

Shower-max Response Uniformity (along \hat{r})

Shower-max Edge PE Distributions

~0.5 cm bins in r

~1 cm bins in phi

New Idea for Shower-max Detectors and Ring

Half-width, “half-stack” **OPEN** Shower-max

Rational: Resolution was too good; this provides more focused energy acceptance; fewer layers/thinner (less \$)

Half-width, “full-stack” **CLOSED** Shower-max

Rational: Provides more focused energy acceptance; still may want 4 layers but could be thinner (less \$)

TRANSITION Shower-max: Still full width, but now twice as many

- ❖ New idea for ring configuration (radial view): 7 open, 7 closed, and 28 transition detectors.

Will explore thinner stack and/or fewer layers

Prototype, Testbeam and MC benchmarking

- Goal: Construct prototype(s) and test with 5 - 8 GeV electrons (somewhere: SLAC, FNAL ???); have \$15k pre-R&D funds
- Engineer special prototype capable of operation with systematically more stack layers added and with no light guide
 - First take data with only one piece of quartz
 - Then add the first tungsten pre-radiator, then the next layer of tungsten and quartz...
 - This will facilitate Monte Carlo Benchmarking of optical quartz properties and G4's showering process without light guide complication
 - Then add a simple light guide and collect data
- Also construct full scale prototype (with same stack configuration) and with full light guide

Director's Review Recommendations (Shower-max related)

- Splashback from the Shower Max Detector should be simulated to see the impact on the Thin Detector ring signals
- Cross-talk between detector regions due to showering in the support structure of the Thin Detector should be simulated. If a straightforward aluminum frame turns out to be problematic, a more expensive and challenging carbon frame option could be investigated.
- Conduct radiation damage tests to at least 50MRad to qualify fused silica for use in the thin detector.
- Estimate the Q_{weak} double-difference systematic (go beyond crude estimate presented by Kent on the second morning in closed session) for both quartz and shower-max detectors.

Backup Slides

LG reflectivity radiation hardness study

25 MeV LINAC (Main Hall and Airport)

RF Frequency: 2856 MHz (S-Band)
 Energy Range: ~4-25 MeV (current varies)
 Pulse Width: ~50ns to 4 micro seconds
 Repetition Rate: single pulse to 360 Hz
 Ports: 0 degree, 45 degree and 90 degree (Beam energy resolution ~ 1+/- 15%)

25B Energy vs Current			
Energy (MeV)	0 port (mA)	45 port (mA)	90 port (mA)
23	55	55 @ 3.8uS	46 @ 3.6 uS
20	100	70 @ 4. uS	65 @ 4 uS
16	100	48 @ 3.6 uS	48 @ 3.6 uS
13	80	30 @ 3.3 uS	15 @ 3.3 uS
10	60	18 @ 3.1 uS	7.5 @ 3.1 uS
9	110	30 @ 4 uS	15 @ 4 uS
6	100	60 @ 4 uS	60 @ 4 uS
4	50	20 @ 4 uS	20 @ 4 uS

- Used 8 MeV e⁻ beam, 65 - 110mA I_{peak}, 4μs pulse width at 250 Hz, 310 – 880 W

- Water-cooled (15° C) aluminum brick w/ 1.5 cm radius hole (for beam) – more than adequate cooling.

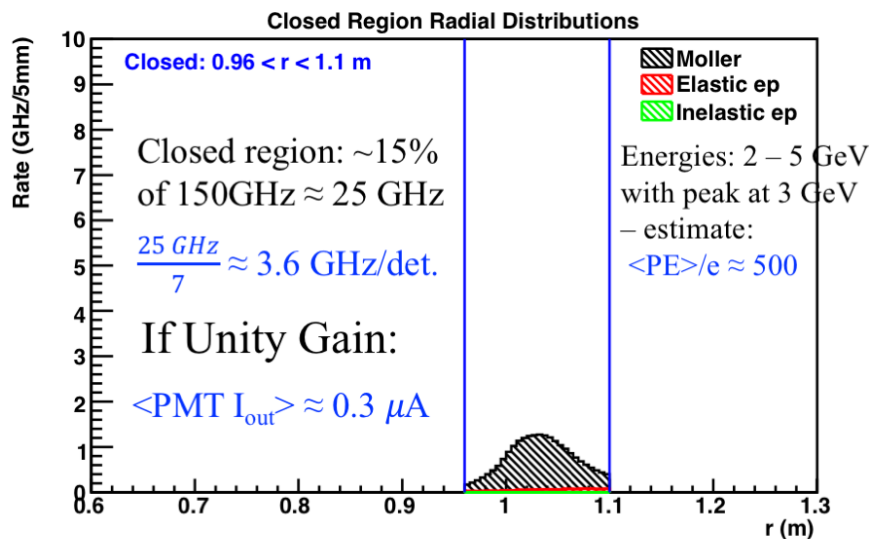

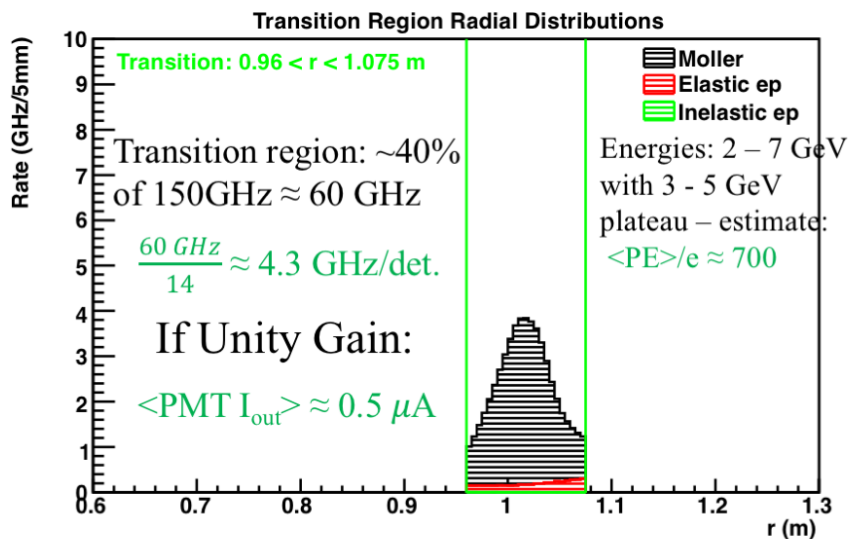

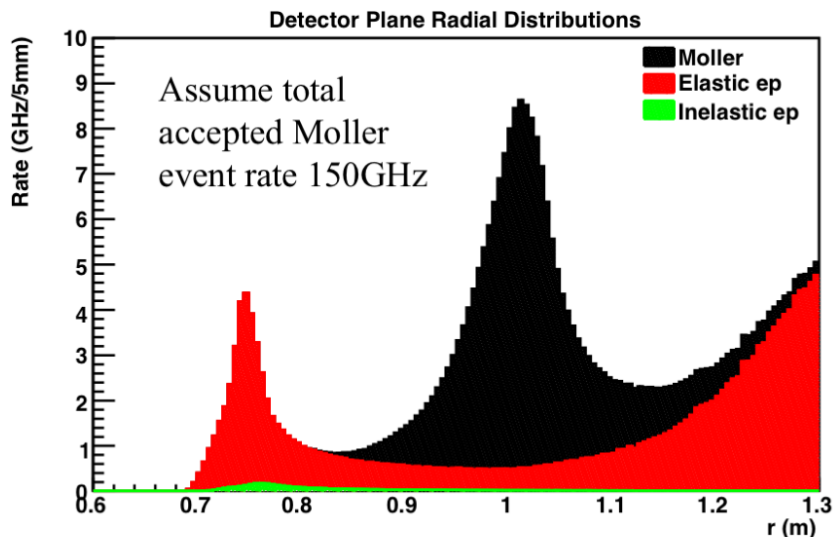

• Reflectivity measurement apparatus

Irradiated several light guide material samples over a 3 day period from Mar 22 - 24, 2016:

- Miro-silver 4270
- Anolux UVS
- Miro 2000Ag (diffuse)
- Miro-silver 27 (from Michael)
- Alzak-Al and Alzak-Ag (from KK)
- 1 mil, single-sided aluminized mylar

Unity Gain operation with Baseline design?

- Could be possible to use conventional 3" pmts with electronic switching between unity gain base (integrating mode) and high gain base (counting mode)
